Abstract:

Pain relief during labour is now regarded as beneficial component of proper obstetric care.

There are different methods for pain relief during labour as psychological methods, physical methods, inhalation analgesia, systemic analgesia, local anesthesia and regional anesthesia.

Successful use of each method requires knowledge of the technique, advantages, disadvantages, dosages, and route of administration for the method to be both successful and safe for both mother and fetus.

Key words:

Labour – physical methods – epidural analgesia

ACKNOWLEDGMENT

First of all, I would like to thank God for His grace and mercy, and for giving me the effort to complete this work.

I would like to express my deepest gratitude and greatest respect to Professor Dr. Diaa El Deen Sarhan, Professor of Obstetrics and Gynaecology, Cairo University under whose supervision I had the honour and pleasure to proceed with this work. Her constant guidance encouragement and foresight made all the difference.

I would also like to express my sincere thanks to Dr. Osama Abdel Aziz El-Shenoofy, Assistant Professor Obstetrics and Gynaecology, Cairo University for her continuous guidance, encouragement and creativity in initiating and completing this work to whom I will always be indebted.

My Deepest appreciation goes to Dr. Ashraf Sameer Younis, Lecturer of Obstetrics and Gynaecology, Cairo University, for her supervision, advice and effort during preparation and completion of the present work.

*To My Parents, Their Constant Love,
Support And Sacrifice Made This Work Possible.*
