

# Evaluation of Computer-guided Condylar Positioning Device in Bilateral Sagittal Split Osteotomies

Thesis

Submitted for Partial Fulfilment of the Requirements for the Doctor's  
Degree in Oral and Maxillofacial Surgery

By

***Adel Hamdy Abou-ElFetouh***

B.D.S., M.Sc.

Faculty of Oral and Dental Medicine,  
Cairo University

2012

# Supervisors

## **Dr. Maha Mohamed Hakam**

*B.Ch.D., M.Sc., Ph.D. (Cairo)*

Professor of Oral and Maxillofacial Surgery, Faculty of  
Oral and Dental Medicine – Cairo University.

## **Dr. Ahmed Abd ElMonoem Barakat**

*B.Ch.D., M.Sc., Ph.D. (Cairo)*

Professor of Oral and Maxillofacial Surgery, Faculty of  
Oral and Dental Medicine - Cairo University.

## **Dr. Hesham ElHawwary**

*B.D.S., M.Sc., Ph.D. (Cairo)*

Lecturer of Oral and Maxillofacial Surgery, Faculty of  
Oral and Dental Medicine – Cairo University

# Acknowledgement

No words can express the great grace that ALLAH has endued upon me. He granted me the will and patience to fulfill this demanding piece of work.

My deepest thanks and gratitude to *Dr. Ahmed Barakat*; my tutor, mentor and elder brother. Your highly motivated, innovative, inspirational and responsible character had and will continue to have a great influence on me. Many colleagues insist that I am becoming a miniature replica of your highly admired self; and to tell you the truth; this is a true pleasure for me and an honour I do not deserve...

I would also like to thank *Dr. Maha Hakam*; my dear professor; for her continuous support and guidance that paved the way for this work. Your enlightened thoughts and bright ideas added a lot to the genuineness of our research.

My deepest sense of gratitude goes to my parents whom I love and admire more than they think I do! They taught me how to strive for perfection and raised me up to be self-dependent. Without their support and guidance, this research would never have been completed. I hope that this thesis in its final form is a modest reward for their efforts and patience throughout the years. And I also cannot forget to thank my younger sisters who have always been supportive and encouraging over the years.

Many thanks to my dear wife, her ideas and comments added positively to the value of this research. Without your emotional support, this paper would have never been possible. And to my son and daughter, your smiles were the only haven in the hard days.

I cannot forget to thank Dr. Amr Maher; our anesthesiologist, statistician and magician! You are a very special person to me.

# List of Figures

| Figure Number | Legend  | Page Number |
|---------------|---|-------------|
| ١             | Standard clinical extra- and intra-oral photographs of patient number ١   | ٣٨          |
| ٢             | i-CAT   | ٣٩          |
| ٣             | DICOM data imported into the surgical planning software and the axial, coronal and sagittal reformats calculated. Segmentation of the CBCT dataset to select the area of interest of the facial bony skeleton (highlighted in yellow) | ٤٠          |
| ٤             | Three-dimensional reconstruction of the facial bony skeleton generated from the CBCT data.  | ٤١          |
| ٥             | Construction of the mid-sagittal (above) and Frankfurt horizontal (below) planes to orient the virtual skull in the three dimensions of space   | ٤٢          |
| ٦             | Virtual cutting planes constructed at the level of the cemento-enamel junctions of maxillary and mandibular teeth to separate the artifact dentition (in cyan)  | ٤٣          |
| ٧             | Three-dimensional reconstruction of the scanned maxillary (red) and mandibular (yellow) casts   | ٤٤          |
| ٨             | Point-based registration of the maxillary cast dentition to artifact-free dental landmarks of the CBCT in the axial, coronal and sagittal views. This image shows point registration of the right cuspid cusp tip                     | ٤٤          |
| ٩             | An artifact-free composite skull / dentition model in preoperative occlusion  | ٤٥          |
| ١٠            | Medial (horizontal), anterior (vertical) and connecting (sagittal) cutting planes constructed to complete the virtual BSSO  | ٤٦          |
| ١١            | Lateral view of the virtual ٣D mandible after the right and left proximal segments were separated from the distal segment   | ٤٦          |
| ١٢            | Medial view of the virtual ٣D mandible after the right and left proximal segments were separated from the distal segment. Note placement of the medial cut just above the lingula   | ٤٧          |
| ١٣            | Segmentation of the right and left inferior alveolar nerves in the axial, coronal and sagittal ٣D images and calculation of the ٣D nerve pathway (lower right corner)   | ٤٨          |

|    |   |    |
|----|---|----|
| ١٤ | An image of the virtual 3D mandible with the pathways of the inferior alveolar nerves inside the mandibular rami highlighted in orange  | ٤٨ |
| ١٥ | The pre-osteotomy template consisted of a proximal and a distal part connected together by ٧ arms. Two ٧.١ mm wide holes were incorporated in to each part of the template through which positioning screw-holes were to be drilled   | ٤٩ |
| ١٦ | A top view of the virtual osteotomized mandible showing the pre-osteotomy template engaging the anterior border of the ramus. Such a design allowed secure and accurate positioning of the template intraoperatively  | ٥٠ |
| ١٧ | 3D reconstruction of the CBCT-scanned casts in final occlusion  | ٥١ |
| ١٨ | Fig. ١٨: A virtual 3D image of the distal segment and teeth after they have been registered to the mandibular cast dentition in final occlusion. Note the proximal segments (in orange and violet) still maintain their pre-osteotomy positions. The proximal (green) and distal (blue) parts of the template also maintain their relationship to their corresponding mandibular segments | ٥١ |
| ١٩ | A 3D view of the virtual BSSO of patient number ١ showing the resultant gap between the proximal and distal segments in the right side, this gap was maintained as indicated by the arrow   | ٥٢ |
| ٢٠ | 3D view of the distal segment in its final position with some interference with the left proximal segment in its preoperative position  | ٥٣ |
| ٢١ | The same view after the proximal segment has been manipulated to alleviate the interference (in green). Note that the new position of the proximal segment maintained the same vertical and AP positions  | ٥٣ |
| ٢٢ | The post-BSSO template connecting the proximal segment; in its original pre-osteotomy position; to the distal segment in its new position dictated by the final desired occlusion. ٤.٠ mm wide holes have been added to the proximal part of the template to determine the location of the fixation screws  | ٥٤ |
| ٢٣ | The locations of the fixation screws have been chosen so as to avoid injury of the inferior alveolar nerve in its new simulated position as dictated by the movement of the distal segment  | ٥٥ |

|    |   |    |
|----|---|----|
| ٢٤ | A 3D view showing the right and left post-BSSO templates as well as the horse-shoe shaped block between the maxillary and mandibular dentition in final occlusion   | ٥٦ |
| ٢٥ | Top view of the virtual wafer showing indentations of the maxillary teeth   | ٥٦ |
| ٢٦ | To the left: The additive manufacturing (rapid prototyping) machine used for template fabrication. To the right: Two of the condylar positioning templates in addition to the occlusal wafer fabricated in plastic  | ٥٧ |
| ٢٧ | An intraoperative photograph of patient number ٦ showing the incision along the external oblique ridge  | ٥٩ |
| ٢٨ | After complete reflection of the masseter muscle off the lateral surface of the ramus, the pre-osteotomy template was placed engaging the anterior border of the ramus for secure placement   | ٥٩ |
| ٢٩ | An intraoperative photo of patient #٦ showing the pre-osteotomy template fixed to the body of the mandible using screws while positioning screw holes are being drilled in their pre-planned positions on the ramus through the template. The template was then removed | ٦٠ |
| ٣٠ | Another photo of the pre-osteotomy template in place, shown here in patient number ٧. The BSSO cuts were completed but the mandible was not split yet.  | ٦١ |
| ٣١ | After identification and protection of the nerve, the medial cortex of the ramus was cut using a Lindmann bur from the anterior border of the ramus to the retrolingular depression   | ٦٢ |
| ٣٢ | A photograph of patient number ٣ showing the anterior vertical cut through the buccal cortex at the area of the second molar  | ٦٢ |
| ٣٣ | Fissure bur holes were drilled along the external oblique ridge and anterior border of the ramus from the vertical buccal cut to the medial cut . These holes were then connected to complete the connecting cut  | ٦٣ |
| ٣٤ | Spatula chisels were used to carefully split the ramus of the mandible in a sagittal direction  | ٦٣ |
| ٣٥ | A photograph of the final wafer in place after completion of the BSSO, intimate fitting of the maxillary and mandibular dentition in to the wafer can be clearly seen   | ٦٥ |
| ٣٦ | With the wafer in place and secured using MMF, the post-osteotomy template was secured to the proximal and distal segments using the same pre-drilled positioning screw holes. The template repositioned the proximal segment to its preoperative position while the    | ٦٦ |

|    |  |    |
|----|--|----|
|    | gap (green arrow) created between the segments was maintained  |    |
| ٣٧ | Another photo for the post-osteotomy template in place, shown here in patient number ١.  | ٦٦ |
| ٣٨ | Fixation screws (green arrow) were inserted in their pre-planned positions through the template and the template removed.  | ٦٧ |
| ٣٩ | Axial view at the greatest mediolateral dimension of the right mandibular condyle showing the mid-sagittal line (in red), the preoperative condyle position (in greyscale) and the contour of the superimposed postoperative condyle position (in blue). Distances were measured as two parallel lines (pink & yellow) from the medial poles of the condyles uptill and perpendicular on the mid-sagittal line   | ٧٠ |
| ٤٠ | The same axial view with the condylar long axis constructed by a line passing from the lateral to medial poles, in light blue is the preoperative condylar long axis while in pink is the postoperative condylar long axis. The angle formed between each long axis and the mid-sagittal line was then measured and the difference calculated.   | ٧١ |
| ٤١ | A sagittal cut passing through both the condylar head and neck showing the preoperative condyle (in grayscale) and the postoperative condyle outline (in blue). The sagittal long axis of each condyle was projected from the summit of the condyle and passing tangent to the anterior border of the condylar neck, in red is the preoperative sagittal condylar long axis while in green is the postoperative one. The angle formed between both axes was measured | ٧٢ |
| ٤٢ | Sagittal view showing vertical distances measured from the pre- and post-operative condyles to the Frankfurt plane   | ٧٣ |
| ٤٣ | A coronal plane constructed perpendicular to the Frankfurt and mid-sagittal planes   | ٧٣ |
| ٤٤ | Sagittal view showing horizontal distances measured from the pre- (yellow line) and post-operative (green line) condyles to the constructed coronal plane. The difference in lengths indicates the AP condylar position change   | ٧٤ |
| ٤٥ | Coronal section through the mandibular rami showing their very thin buccolingual dimension as well as the intimate   | ٧٥ |

|    |  |    |
|----|--|----|
|    | contact between the inferior alveolar nerve (in orange) and the buccal cortex.   |    |
| ٤٦ | A pie-chart representation of the gender distribution.   | ٧٦ |
| ٤٧ | The final and near final achieved occlusion for patients number ٤ and ٧ respectively.  | ٨١ |
| ٤٨ | A bar-chart representation of the mean pre- and post-operative MIOs.   | ٨٢ |
| ٤٩ | Coronal sections showing relationship of the bicortical fixation screws to the inferior alveolar nerve (in orange).  | ٨٨ |
| ٥٠ | ٣D view of the superimposed postoperative mandible showing the relationship between the planned fixation screw holes incorporated into the post-osteotomy template (in grey) and the actual screws location (projected in yellow). | ٨٩ |

# List of Tables

| Table Number | Title   | Page Number |
|--------------|---|-------------|
| ۱            | The planned surgical linear displacements and angular rotations of the mandibular distal segment in skeletal class II and class III groups of patients. | ۷۸          |
| ۲            | Statistical data of the pre- and post-operative maximal incisal openings (MIOs).  | ۸۲          |
| ۳            | Descriptive data of the right and left condylar position changes in the various palnes for each patient.  | ۸۵          |
| ۴            | One - sample <i>T</i> - test statistical analysis for the normally distributed condylar position changes variables.                                     | ۸۶          |
| ۵            | One – sample <i>T</i> - test statistical analysis of the non-normally distributed condylar position changes variables.                                  | ۸۷          |

Bilateral sagittal split osteotomies (BSSO) is one of the main orthognathic surgery tools for managing skeletal mandibular excess, deficiency or asymmetry. However, BSSO is known to be a technique-sensitive procedure with high reported incidences of inferior alveolar nerve injury, maldirected splits and post-surgical relapse.

Post-surgical relapse has been classified into immediate and delayed relapse. The immediate relapse has been mainly attributed to improper seating of the mandibular condyles in the glenoid fossae whereas delayed relapse has been attributed to unstable occlusion, inadequate fixation and condylar resorption.

Good dental occlusion following BSSO is dependent on a normal temporomandibular joint; that is, dental malocclusion or abnormal interdigitation with normal condylar position can be controlled postoperatively by orthodontic treatment, but an abnormal condylar position cannot be corrected postoperatively and eventually disrupts postoperative occlusal stability. There are many factors affecting postoperative condylar position—for example, the surgeon's experience, movement (forward, backward, or rotational) of the distal segment of the mandible, the anatomic shape and orientation of the proximal segment, and the fixation method. Various authors have stressed avoiding condylar displacement and have suggested several methods for guiding the postoperative position of the condyle.

Inferior alveolar nerve affection; whether temporary or permanent; is said to be due to medial reflection and retraction, direct injury during medial cutting, chisel injury during splitting, drilling through the canal during screw fixation and
