Acknowledgement

*I would like to start with thanking **ALLAH** for granting me the ability to complete this work.*

*I would like to express my gratefulness to Professor **Dr. Mohamed Hany Shehata**, Professor of Obstetrics and Gynecology, Faculty of Medicine, Cairo University, for his supervision, advice, support, and guidance throughout this work.*

*I would also like to express my deepest thanks to **Dr. Ahmed Soliman Nasr**, Assistant Professor of Obstetrics and Gynecology, Faculty of Medicine, Cairo University. He spent generously his time in close supervision, encouragement, constructive criticism and great help in revising this thesis.*

*I am deeply indebted to department 21 team; **Dr. Eman El-Kattan** and **Dr. Hassan Gaafar**, Lecturers of Obstetrics and Gynecology, Faculty of Medicine, Cairo University, for their great coordination, help, guidance and care. Their effort and encouragement are indeed beyond the capability of words.*

Abstract

Early pregnancy loss is the commonest complication of pregnancy, and represents a major clinical workload for the gynecologist. It is estimated that around 40% of early pregnancies result in miscarriage.

Elective termination of pregnancy is widely performed throughout much of the world. Despite its safety, yet, the general rate of complications for surgical evacuation ranges from 1.4% to 8.4%, of which the incidence of retained products of conception (RPOC) constitutes 1-3%, which is relatively high.

Therefore, if a non-invasive procedure such as ultrasound can reduce the number of patients having a repeated D&C, then the overall number of complications can be reduced.

With the evolution of transvaginal sonography (TVUS), a dramatic increase in the information obtained regarding uterine abnormalities and intrauterine contents has occurred.

This study aims at establishing the role of TVUS together with Doppler in the evaluation after elective termination of first trimester pregnancy.

Key-words: *termination of first trimester pregnancy, RPOC, TVUS, Doppler.*

CONTENTS

 <u>Introduction</u>	1
 <u>Aim Of Work</u>	3
 <u>Review Of Literature</u>	
☒ Physiological and Embryological Background	4
☒ Abortion	19
☒ Ultrasound Evaluation Of Early Pregnancy	31
• Ultrasonographic evaluation of normal early pregnancy	35
• Ultrasonographic evaluation of abnormal early pregnancy	43
☒ Doppler Ultrasonography Of The Uteroplacental Circulation In Early Pregnancy	
• Physical principles of the Doppler effect and its application in medicine	56
• Doppler velocimetry of the uteroplacental circulation in normal pregnancy.	62
• Doppler velocimetry during abnormal pregnancy and early pregnancy failure	64
☒ Role Of Transvaginal Sonography And Doppler In The Diagnosis Of Retained Products Of Conception	67
• Figures illustrating the role of TVUS and Doppler after first trimester abortion.	73

List of Abbreviations

ACA	Anticardiolipin antibodies
AP	Anteroposterior
APL (aPL)	Antiphospholipid antibodies
Bpm	Beat per minute
CDI	Color Doppler imaging
CHMs	Complete hydatidiform moles
Cps	Cycles per second
CRL	Crown-rump length
CW	Continuous wave Doppler
D&C	Dilatation and curettage
D&E	Dilatation and evacuation
DES	Diethyl stilbesterol
DT	Doubling time
EDRF	Endothelium derived relaxing factor
FSH	Follicle stimulating hormone
FVWs	Flow velocity waveforms
GA	Gestational age
HCG (hCG)	Human chorionic gonadotrophin
HIV	Human immuno-deficiency virus
HLA	Histocompatibility locus antigen
HM	Hydatidiform mole
Hz	Hertz
IFN	Interferon
IL	Interleukin
IS	International standard

IUP	Intra-uterine pregnancy
LAC	Lupus anticoagulant
LH	Luteinizing hormone
LMP	Last menstrual period
MSD	Mean sac diameter
MTHFR	Methylene tetrahydrofolate reductase
PCO	Polycystic ovaries
PGI2	Prostacyclin
PI	Pulsatility index
PHMs	Partial hydatidiform moles
PRF	Pulse repetition frequency
<i>P-value</i>	Probability value
PW	Pulsed wave Doppler
RI	Resistance index
ROC analysis	Receiver operator characteristic analysis
RPOC	Retained products of conception
SD	Standard deviation
S/D ratio	Systolic/diastolic ratio
SGA	Small for gestational age
TH 1	T-helper 1
TH 2	T-helper 2
TNF	Tumor necrosis factor
TOP	Termination of pregnancy
TSH	Thyroid stimulating hormone
TVS	Transvaginal sonography
TVUS	Transvaginal ultrasonography
US	Ultrasonography
VEGF	Vascular endothelial growth factor

List of Figures

FIGURE	CONTENT	PAGE NUMBER
Fig. (1)	Cross section of uterus at 6, 8, and 10 weeks menstrual age showing embryonic membrane & their development	7
Fig. (2)	The vessels within the uterus in early pregnancy. Arcuate vessels traverse the myometrium as radial branches that supply the deciduas capsularis & vera	۱۲
Fig. (3)	Anatomy of arcuate, radial,& spiral arteries during pregnancy	۱۲
Fig. (4)	Normal blood supply to the placenta. The termination of radial arteries each into two spiral arteries that have been physiologically converted to uteroplacental arteries	۱۵
Fig. (5)	Abnormal blood supply to the placenta. Physiologic changes in some decidual segments of spiral arteries are absent. Myometrial segments are shown without physiologic changes as in preeclampsia or some cases of fetal growth restriction	۱۷
Fig. (6)	Transvaginal sonogram showing an early intrauterine pregnancy of 4 weeks gestation	۳۵
Fig. (7)	Double decidual sac sign. The gestational sac is covered by the combined chorion-decidua capsularis. The decidua parietalis is seen on the opposite side of the uterine cavity	۳۷
Fig. (8)	Six weeks; gestational sac, yolk sac & embryo in a normal pregnancy	۳۸
Fig. (9)	Transvaginal sonogram of a 7-week pregnancy, illustrating the rhombencephalon	۴۰
Fig. (10)	Transvaginal sonogram of an 8-week pregnancy. Limb buds are seen	۴۱
Fig. (11)	Amnion seen as a thin membrane surrounding the embryo	۴۲
Fig.(12)	Transvaginal sonogram of early embryonic demise, showing an empty gestation sac with a mean diameter of more than 20mm	۴۵
Fig. (13)	In an anembryonic gestation, the gestational sac fills the uterine cavity, with no visible embryo or yolk sac	۴۵

Fig. (14)	Transvaginal sonogram showing RPOC, in keeping with an incomplete miscarriage	٤٦
Fig. (15)	First trimester complete moles. A) Sagittal sonogram of the uterus in a patient at 9.3 weeks gestational age demonstrating complex intrauterine mass containing multiple cystic areas. B) Sonogram of a similar case at 9.9 weeks gestational age demonstrating an intrauterine mass with cystic areas	٥١
Fig. (16)	Ultrasound image of sonographically suspected partial hydatidiform mole (PHM) a) Histologically proven PHM b) non-molar failed pregnancy	٥١
Fig. (17)	Transvaginal sonogram of tubal ectopic pregnancy- inhomogeneous conglomerate	٥٣
Fig. (18)	Pseudogestational sac of an ectopic pregnancy is seen as a central fluid collection simulating an intrauterine pregnancy	٥٣
Fig. (19)	Transvaginal sonogram of tubal ectopic pregnancy- gestation sac & yolk sac present	٥٥
Fig. (20)	The Doppler equation	٥٧
Fig. (21)	Continuous & pulsed wave Doppler system	٥٨
Fig. (22)	Spectrum parts used in the calculation of RI & PI	٦١
Fig. (23)	Normal thin endometrium. Sagittal image of uterus from a transvaginal sonogram 9 days after a first trimester spontaneous abortion. The endometrium was thin, measuring only 1.2 mm in thickness. Clinically significant retained products of conception are unlikely with such a thin endometrium and this patient did well clinically with non-surgical treatment	٧٣
Fig. (24)	Transvaginal sagittal sonogram of a uterus immediately after repeated D&C. A thin hyperechoic echo is shown, characteristic of an empty uterus	٧٣
Fig. (25)	Sagittal image of the uterus showing a normal endometrial thickness measuring 3 mm without an endometrial mass or endometrial fluid. The patient did not have retained products	٧٤

Fig. (26)	Transvaginal sonograms without (A) and with (B) color Doppler imaging from a 24-year-old asymptomatic woman 10 days after TOP showing a heterogeneous, thickened, and irregular endometrium with increased color Doppler flow, findings normally associated with RPOC	୪୧
Fig. (27)	Transvaginal sonograms without (A) and with (B) color Doppler imaging from a 23-year-old asymptomatic woman 7 days after TOP showing a poorly defined 13-mm endometrium of mixed echogenicity with prominent color Doppler flow entering the endometrial cavity	୪୦
Fig. (28)	Thick endometrium. Sagittal image of retroverted uterus from a transvaginal sonogram with color Doppler, after first trimester spontaneous abortion. The endometrium was thick, measuring 13 mm in thickness. Despite the absence of detectable flow by Doppler, there were retained products of conception present on subsequent dilatation and evacuation	୪୦
Fig. (29)	Thick endometrium with flow by color Doppler. A, Sagittal image of retroverted uterus from a transvaginal sonogram in a patient with continued bleeding after dilatation and evacuation (D&E) for a first trimester spontaneous abortion. The endometrium was thick and heterogeneous, measuring 14 mm in thickness. B, Color Doppler image in same patient shows flow (arrows) within the heterogeneous endometrium. Flow was also seen in the posterior myometrium. Repeat D&E revealed retained products of conception	୪୧
Fig. (30)	Sagittal image of the uterus showing a thick endometrium measuring 25.3 mm. On surgical pathologic examination, no retained products were found. The thickened endometrium was found to represent a necrotic decidualized endometrium and a blood clot	୪୪

Fig. (31)	A, Sagittal image of the uterus showing an echogenic mass in the endometrial cavity (outlined by calipers). On surgical pathologic examination, this mass was found to represent RPOCs. B, Transverse color Doppler image of the uterus shows blood flow (arrowheads) within the endometrial mass	٧٧
Fig. (32)	Transvaginal sonography without (A) and with (B) color Doppler imaging shows findings characterized as a vascular uterine mass, which was thought to be exclusively endometrial according to one radiologist and as having myometrial involvement according to the other radiologist. The final pathologic diagnosis was RPOC	٧٨
Fig. (33)	Endometrial mass due to retained products of conception. Sagittal image from a transvaginal sonogram in a patient with bleeding after a spontaneous abortion. A focal endometrial mass is present. Subsequent dilatation and evacuation (D&E) revealed retained products of conception	٧٨
Fig. (34)	Transvaginal sagittal sonogram of a uterus with RPOC after D&C for abortion. Hyperechoic and hypoechoic material measuring 18, 23 mm is shown. The interface between the endometrium and myometrium is irregular	٧٩
Fig. (35)	Transvaginal sonogram showing abundant flow at the level of the fundus and posterior wall of the uterus in a patient with first trimester spontaneous abortion, clinically thought to be complete	٧٩
Fig. (36)	The same patient in Fig. (35). Flow velocity waveform showing high velocity low resistance flow typical of retained trophoblastic tissue	٨٠
Fig. (37)	Transvaginal sonogram showing scattered color spots at the level of the arcuate network but no flow within the endometrium or myometrial-endometrial interface. In this case, no retained tissue was suspected	٨٠
