PERFORMANCE OF AUTOMOTIVE AIR SUSPENSION CONTROL SYSTEM

A Thesis submitted in partial fulfillment of the requirements of the degree
of Master of Science in Mechanical Engineering (Automotive
Engineering)

by

Eng. Mohamed Essam Shalabi

Bachelor of Science in Mechanical Engineering

(Automotive Engineering)

Faculty of Engineering, Ain Shams University, 2010

Supervised by

Associate Prof. Nabila Shawky Al Nahas

Dr. Ahmed Ibrahim Abdel-Aziz

Cairo - (2016)

Statement

This thesis is submitted as a partial fulfilment of Master of Science in Mechanical Engineering (Automotive Engineering), Faculty of Engineering, Ain Shams University.

The author carried out the work included in this thesis, and no part of it has been submitted for a degree or a qualification at any other scientific entity.

Student name

Mohamed Essam Shalabi

Signature

.....

Date: January 9th 2016

Researcher Data

Name : Mohamed Essam Shalabi Elghwabi

Date of birth : 19/09/1988

Place of birth : Cairo, Egypt

Last academic degree : B.Sc. in Mechanical Engineering

Field of specialization : Automotive Engineering

University issued the degree: Ain Shams University

Date of issued degree : 2010

Current job : Demonstrator

Thesis Summary

This thesis is concerned with the evaluation of the automotive air suspension system performance experimentally and theoretically and its effect on ride comfort behaviour.

A mathematical model was introduced that simulate conventional suspension system performance as a datum and studies the effect of changing the mass ratio, the stiffness ratio and damping ratio on its performance

An existing test rig was modified in which the required experimental work was carried out. An excitation input was developed in terms of frequency and amplitude by using an adjustable eccentric cam assembly to obtain variable excitation input amplitudes. The cam rotational speed was changed using an inverter to control the excitation frequency. An air suspension assembly was installed in which the air spring is connected to two separate air reservoirs through two On/Off valves from which the air pressure can be adjusted to control the initial stiffness value. A steel structure was also added to guide the vertical movement of the sprung mass. The acceleration of the mass and the pressure of the air spring have been measured at the different operating conditions in terms of excitation amplitudes and frequencies values and including the different air volumes.

The experimental results were measured and stored in computer files for further analysis.

A simple mathematical model is proposed that simulates the air spring behaviour which is connected to two additional air reservoirs through two

On/Off valves. The effect of changing the additional volumes through switching on or off the valves is also investigated.

Curves showing variations of air spring stiffness and transmissibility ratio with the input frequency are plotted. Comparison between conventional suspension and air suspension is presented.

The theoretical model is validated using the experimental results. Good correlation between experimental and theoretical results is evident, which indicates the possibility of using the proposed model for further parametric studies.

It is concluded that the air suspension improves the comfort behaviour more than the conventional one through reducing the system natural frequency and amplitude ratio. It was also found that increasing the additional volume reduces the system natural frequency.

Key words: Ride comfort, active suspension, air spring.

Acknowledgment

First I would like to express my gratitude to my parents and supervisors professor **Dr. Nabila Shawky Elnahas** and **Dr. Ahmed Ibrahim Abdel-Aziz** for their help and for educating me in automotive research.

Special thanks to **Dr. Ahmed Ibrahim Abdel-Aziz** for his help in this work. I would like to thank **Associate Prof. Dr. Adel El-Sabbagh** and **Mr. Hisham Hassan** for their help.

Many thanks go to all my colleagues at the Automotive Engineering Department especially, **Eng. Mohamed Abdel-Wahab** for their help with many things.
