

# *Recent Trend in Breast Reconstruction After Mastectomy*

An Essay

Submitted for partial fulfillment of master degree  
in General Surgery

Submitted By

**Nancy Alfarazdaq Moosa Alsebaiy**

M.B., B.Ch.

Under supervision of

**Prof. Dr. IMAM ELSAYED EZZAT FAKHR**

Professor of General surgery

Faculty of medicine, Ain-Shams University

**Dr. HAITHAM MOSTAFA ELMALEH**

Lecturer of General surgery

Faculty of medicine, Ain-Shams University

**Dr. AHMED MOHAMED ABD ELSALAM**

Lecturer of plastic surgery

Faculty of medicine, Ain-Shams University

Ain-Shams University

2013

# *Acknowledgement*

First of all, I thank **Allah** who gave me the power to finish this work which I hope, can be a humble contribution to research in the field of breast surgery.

I would like to express my deepest gratitude and appreciation to **Prof. Dr. IMAM ELSAYED EZZAT FAKHR**, Professor of general surgery, Faculty of Medicine, Ain Shams University, for his guidance and supervision.

I would also express my deepest appreciation and greatest thanks to **Dr. HAITHAM MOSTAFA ELMALEH**, Lecturer of general surgery Faculty of Medicine, Ain Shams University, who was very kind and patient to me, saving no time nor effort helping me through this work.

And my warmest thanks to **Dr. AHMED MOHAMED ABD ELSALAM**, Lecturer of Plastic and Reconstruction Surgery, Faculty of Medicine, Ain Shams University, for his help and encouragement through this work.

Lastly, I will never forget how much my husband stands by me. And of course I would like to dedicate the honor of this research to my beloved mom who supported me to continue my persistent ambition to complete this work.

<b>PR</b>	Progesterone receptor
<b>SGAP</b>	Superior gluteal artery perforator flap.
<b>SIEA</b>	Superficial inferior epigastric artery flap
<b>SLN</b>	Sentinal lymph node
<b>SLNB</b>	Sentinel lymph node biopsy

<b>SLNB</b>	Sentinal lymph node biopsy
<b>SPECT</b>	Single photon emission CT
<b>SSM</b>	Skin sparing mastectomy
<b>TGF</b>	Tumour growth factor
<b>TNM</b>	Tumor-nodes-metastasis
<b>TRAM</b>	Transverse rectus abdominis myocutaneous flap
<b>TUG</b>	Transverse upper gracilis musculocutaneous flap.
<b>VRAM</b>	Vertical rectus abdominus myocutaneous flap

# *Introduction*

Breast cancer is the most common malignancies in females. Prognosis and survival rate varies greatly depending on cancer type and staging. The treatment depends on staging as 10 years disease free survival varies from 10% to 98%. Treatment includes surgery, drugs (hormonal therapy and chemotherapy) and radiation (*Krueger et al, 2001*).

Mastectomy involves the removal of breast tissue, varying amounts of skin and invariably the nipple-areola complex. The removal of these tissues results in the loss of volume, shape and contour of the breast. Breast reconstruction aims to restore these attributes and uses the opposite breast as an aesthetic reference point (*Snelling et al, 2005*).

Different approaches for breast reconstruction include: using breast expanders, implants, using body's own tissue (autologous tissue reconstruction) or using a combination of tissue reconstruction and implants (*Spear et al, 2007*).

Breast reconstruction generally consists of two stages: restoration of the breast mound and reconstruction of the nipple-areola complex. The choice of technique is dictated by a variety of factors that include the size and shape of the native breast, the location and type of cancer, the availability of tissues around the breast and at other sites, the age of the patient, the patient's medical risk factors, and the type of adjuvant therapy. The final decision is often made on the basis of the patient's preference. The patient's selecting the technique and understanding its nature will result in the best aesthetic result and, more importantly,

maximize her satisfaction and quality of life (*Cordeiro, 2008*).

In the era of oncoplastic breast surgery, reconstruction techniques represent an important field of research and development aiming to find the most suitable pathway to manage such a disease with diverse clinical scenarios in order to have the most suitable option for every single patient.

## *Aim of the Work*

To Study the recent trends in breast reconstruction following mastectomy, regarding their techniques, advantages and limitations.
