

**PREVALENCE OF PARASITIC
INFECTION AMONG SCHOOL
CHILDREN IN BENI SUIEF
Governorate**

THESIS

*Submitted for Partial Fulfillment of
Basic Medical Science*

By

Samah Sayed Mohammed Abdel Goad

Demonstrator of Parasitology.

(Cairo University – Beni Suief)

Supervisors:

Prof. Dr. Fadia Mohammed Anwar Amin

*Professor of Parasitology,
Faculty of Medicine, Cairo University.*

Prof. Dr. Maysa Mohammed Kamel

*Professor of Parasitology,
Faculty of Medicine, Cairo University.*

Dr. Eman Yassin Shoeib

*Lecturer of Parasitology,
Faculty of Medicine, Cairo University.*

Faculty of Medicine

Cairo University

2009

Key Word:

- **Parasitic infections.**
- **Intestinal helminthes.**
- **Extraintestinal helminthes.**
- **Protozoal infections.**
- **Factors affecting prevalence of parasites.**
- **Stool examination by different methods.**
- **Symptoms associated with each parasites.**

معدل انتشار الأمراض الطفيلية بين طلبة المدارس

بمحافظة بني سويف

رسالة مقدمة من

الطبيبة/ سماح سيد محمد عبد الجواد

(بكالوريوس الطب و الجراحة-جامعة القاهرة فرع بني سويف)

توطئة للحصول على درجة الماجستير في علم الطفيليات الطبية

تحت إشراف

أ.د/ فادية محمد أنور أمين

أستاذ علم الطفيليات الطبية
كلية الطب
جامعة القاهرة

أ.د./ مایسة محمد كامل

أستاذ علم الطفيليات الطبية
كلية الطب
جامعة القاهرة

د./ إیمان یس شعیب

مدرس علم الطفيليات الطبية
كلية الطب
جامعة القاهرة

كلية طب

جامعة القاهرة

2009

Acknowledgement

I am thankful to GOD for all his kindness and grace, for having granted me the patience to accomplish this work.

I am extremely obliged to Prof. Dr. Hoda Helmy Al-Rahimy, Head of Parasitology Department, Faculty of Medicine, Cairo University, for her encouragement, support and advice.

Sincere gratitude and deepest appreciation to my supervisor Prof. Dr. Fadia Mohammed Anwar Amin, Professor of Parasitology, Cairo University, for her Keen, co-operation, guidance, continuous encouragement and enlightening vision from the early moment of the study till presentation of this work. Her meticulous revision of the work had helped me so much. I am proud to have her as my supervisor.

I am truly grateful to Prof. Dr. Maysa Mohammed Kamel Professor of Parasitology, Cairo University, not only trained me on the scientific research methods, but also helped and supported me during this study. She offered me unremitting care and guidance from the early moment of the study till presentation of this work. Her valuable supervision during the preparation of this thesis will remain a valued memory.

I feel very grateful to Prof. Dr. Mohammed Afifi Afifi, Head of Parasitology Department,

Faculty of Medicine, Beni Suief University, for his suggestion of this thesis.

Grateful as can be to Dr. Eman Yassin shoeib Lecturer of Parasitology, Cairo University, Through her patience, insight and vast knowledge who helped in bringing this research into existence.

Special thanks for all the staff and doctors of Department of Parasitology, Faculty of Medicine, Cairo University, for their help and support during the present study.

I want to thank my mother, my father, my husband, my daughters and my son for their never ending support and ever lasting care and help. Without their support, I would never made any achievement in my life.

Introduction

Parasitic infections are a major health problem. They are endemic in many tropic and subtropic areas particularly in underdeveloped countries where sanitary and ecological factors favour the spread of these infections **(Abdel Wahed, 1984)**.

Intestinal parasitic infections are commonly transmitted through ingestion of contaminated food and water as a result of poor sanitation and hygiene. In some instances, transmission occurs through close contact between infected and uninfected individuals as infected food handlers and consumers, respectively **(WHO, 1987)**.

It is estimated that approximately 3.5 billion people are affected and that 450 million are ill as a result of these infections, the majority being children. Common intestinal parasites such as *Blastocystis hominis* and *Giardia lamblia* are still health challenges of economically developed and developing countries **(Hill et al., 2007)**.

There are many factors that determine the distribution, frequency, wormburden and disease severity in many of these parasitic infections as age, Poverty, illiteracy, poor hygiene, lack of access to potable water and hot and humid tropical climate **(Abdel Salam et al., 1986)**. The prevalence of intestinal parasites among school children in rural areas was significantly higher than in urban areas **(Hammouda et al., 1986)**.

Giardia lamblia was the most common intestinal parasite among children of all social classes. *Entamoeba histolytica* was found among children of middle class, while *Hymenolepis nana* was found among those of lower class **(Ahmed et al., 1990)**.

In developing countries, parasitic infections are more prevalent among farmers and labourers in rural areas due to the existence of many environmental factors and social conditions that favour these infections (**El-Shaffey, 1992**).

In children, parasitic infections lead to malnutrition, malabsorption syndrome, diarrhea, intestinal obstruction and mental and physical growth retardation (**Carbol Urbani, 2001**).

Aim of the work

The aim of the present study is to detect the prevalence of parasitic infections among school children in Beni Suief Governorate and to detect the effect of different factors as age, sex, socioeconomic levels and residence on the prevalence of parasites. Also to detect the most accurate method for detection of different parasites in addition to symptoms associated with each parasite.

Aim of the work

The aim of the present study is to detect the prevalence of parasitic infections in stool and urine among school children in Beni Suief Governorate and to detect the effect of different factors as age, sex, socioeconomic levels and residence on the prevalence of parasites. Also to detect the most accurate method for detection of different parasites in addition to symptoms associated with each parasite.

Review of literature

Parasitic infection is considered one of the most common tropical diseases in developing countries. The prevalence of parasitic infections in developing countries is high and ranges between (30%) and (60%) (Cox, 1982). Some parasites have world wide distribution, but the majority occurs in the tropics (Pawlowskizs, 1984).

Intestinal parasites are estimated to infect more than three billion people worldwide. Most intestinal parasites are heterogeneously distributed in host populations; according to a frequently quoted estimate, (10%) of hosts harbour (70%) of the intestinal helminthes (Anderson and May, 1985).

Some common protozoa, such as *G. lamblia*, *D. fragilis*, and *E. histolytica*, may be associated with sporadic outbreaks in industrialized countries, whereas helminthes have specific geographic distributions and may be rapidly extinguished with improvements in community sanitary conditions. For this reason, helminthic infections are likely to be found in more recent arrivals than in long-term immigrants (Salas *et al.*, 1990).

The overall distribution of parasite prevalence is consistent with that found by most of studies undertaken in many countries, *E. histolytica* and *G. lamblia* being the most common protozoa, while *A. lumbricoides* is the most common helminth (Omar *et al.*, 1991).

Although helminthic infection rate is generally higher than that of protozoa, it is worthy to note that although the differences are significant among HIV seronegative patients, they remain non
