٢٠١٥

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قُلْ لِّمَنَ عِبَادَتَا

صَدَقَ اللَّهُ الْعَظِيمُ

(سورة طه - آية ١١٤)

Acknowledgement

First of all, I thank **ALLAH** for blessing this work as a part of his generous help throughout my life.

I would like to express my sincere gratitude and deepest thanks to **Prof. Dr. Nehal Mohamed Bahgat**, Professor of Physiology, Faculty of Medicine, Ain Shams University, for her scientific support, judicious guidance, generous help and valuable supervision through the whole work. To her, I am deeply indebted and admit I am so much privileged and honored to have her as my supervisor, I really owe her more than I can express.

I would like to display my indebtedness to **Dr. Ramadan Mohamed Ahmed**, Lecturer of Physiology, Faculty of Medicine, Ain Shams University, for his wise council, expert guidance, faithful advice, keen supervision and valuable instructions which helped me to overcome many difficulties.

I would like to display my indebtedness to **Dr. Noha Nooh Lasheen**, Lecturer of Physiology, Faculty of Medicine, Ain Shams University, for her limitless help, kind encouragement and generous assistance throughout the whole work.

I would, also, like to acknowledge my deepest gratitude and appreciation to **Prof. Dr. Faten Mahmoud Diab**, the Head of Physiology Department, Faculty of Medicine, Ain Shams University, for her support and encouragement.

I would, also, like to acknowledge **Dr. Rania A. Salah El Din** associate Professor of Anatomy and Embryology, Faculty of Medicine, Ain Shams University, for her useful and helpful contribution in this work.

Finally, I would like to express my deepest gratitude to all my family and all who did help me and supported me throughout this work.

List of Abbreviations

ABP	Arterial blood pressure
AI	Atherogenic index
BMI	Body mass index
BW	Body weight
BWG	Body weight gain
C	Control group
Ch.	Total cholesterol
CVD	Cardio-vascular diseases
DBP	Diastolic blood pressure
ELISA	Enzyme-linked immunosorbent assay
ER	Estrogen receptors
FB	Fibrinogen
FBG	Fasting blood glucose
FBMI	Final body mass index
FBW	Final changes in the body weight
GLUT	Glucose transporter
HbA1c	Glycated haemoglobin
HDL-C	High density lipoprotein cholesterol
HOMA-IR	Homeostasis model assessment of insulin resistance
HRT	Hormone replacement therapy
IL	Interleukins
IPGTT	Intraperitoneal glucose tolerance test

IRS- 1	Insulin receptor substrate-1
IRS-2	Insulin receptor substrate-2
LDL-C	Low density lipoprotein cholesterol
LSD	Least significant difference
M	Arithmetic Mean
MAP	Mean arterial blood pressure
MS	Metabolic syndrome
MS	Metabolic syndrome- untreated group
MS_E	Metabolic syndrome swim-exercised group
MS_S	Metabolic syndrome soybean-supplemented group
PP	Pulse pressure
PPAR	Peroxisome proliferator-activated receptors
SBP	Systolic blood pressure
SBP	systolic blood pressure
SD	Standard deviation
SEM	Standard error of the mean
SHBG	Steroid hormone binding globulin
SPSS	Statistical Program for Social Science
SREBP	Sterol regulatory element binding protein
TG	Triglycerides
TNF	Tumor necrosis factor
VF	Visceral fat
WC	Waist circumference
WHO	World Health Organization

Introduction

Metabolic syndrome is a disease of unhealthy lifestyle. Imbalanced diet in the form of increased caloric intake and lack of physical activity are the main predisposing factors. Aging and menopause independently increase the incidence of metabolic syndrome as reported by ***Ford et al. (2002) and Janssen et al. (2008).***

World Health Organization (WHO) defined metabolic syndrome by the presence of diabetes mellitus or insulin resistance and two of the following characteristics: a high waist/hip ratio, a high concentration of triglycerides or a low concentration of HDL cholesterol, increased blood pressure, and urinary excretion of albumin, proinflammatory state and prothrombotic state (i.e. high levels of fibrinogen or plasminogen activator inhibitor-1) (***Alberti and Zimmet, 1998).***

The Third report of the National Cholesterol Education Program (***NCEP ATP III report, 2001 and 2002)*** emphasized the role of central obesity in the pathogenesis of metabolic syndrome and defined it by the presence of any 3 of the following: central obesity, increased waist circumference, hypertriglyceridaemia, Low HDL cholesterol, hypertension and fasting hyperglycemia.

Recently, several studies demonstrated increased prevalence of the metabolic syndrome among all age groups in Egypt reaching 39.7% among school students (***Hasssan et al., 2011).*** The prevalence among prepubertal was quite higher than pubertal students and in girls more than boys with abnormal lipid profiles, obesity and insulin resistance (***Hasssan et al., 2011).***

Also in middle aged and elderly Egyptians, the prevalence of metabolic syndrome was potentially higher reaching almost 55 % based on the American Heart Association/Updated NCEP ATP III criteria with 48.2% of the population sample having moderate to high risk of developing cardiovascular disease (***Abd Elaziz et al., 2014***).

Postmenopausal state was also reported to be associated with a 60% increased risk of the metabolic syndrome (***Park et al., 2003***). The risk of cardiovascular diseases attributed to the metabolic syndrome appeared to be especially high in women, and it was estimated that half of all cardiovascular events in women could be related to the metabolic syndrome (***Wilson et al., 1999; Ogbera 2010***).

Based on the above cited data, a growing worldwide prevalence of metabolic syndrome is to be expected in the coming years making it necessary to throw more light on the etiology, treatment and prevention of this syndrome.

Therefore the present study was designed to investigate the ability of lifestyle intervention either by swim –exercise program or diet supplementation with soy bean flour to reverse or alleviate the criteria of metabolic syndrome. The conditions that predispose to metabolic syndrome in humans (namely aging, menopause and unhealthy diet) were simulated in the experimental animals, then the effects of the swim –exercise program and diet supplementation with soybean flour were evaluated on the different features of the metabolic syndrome.

Aim of the work

The present study aimed at evaluating the long term effects of implementing a swim- exercise program and soybean flour supplementation in diet on the various components of the metabolic syndrome in aged female rats.

Review of Literature

Metabolic Syndrome

Metabolic syndrome (MS) is defined as a collection of risk factors including elevated blood levels of fasting glucose, total cholesterol, LDL-cholesterol, triglycerides as well as increased arterial blood pressure and central adiposity. Metabolic syndrome was reported to be associated with increased risk for cardiovascular disease (CVD) and type 2 diabetes (**Alberti et al., 2009**).

Although the global prevalence of the metabolic syndrome is difficult to estimate (**Alberti et al., 2009**), yet it shows simultaneous increase in populations around the world (**Ervin, 2009**). Also, the prevalence of the individual components of the metabolic syndrome, as well as the syndrome as a whole, are highly variable among different ethnic populations (**Cameron et al., 2004**).

The Metabolic syndrome is considered a worldwide problem affecting both developed and underdeveloped countries in a rapidly progressive way (**Allal-Elasmi et al., 2010**). Differences in genetic profile, eating habits, physical activity, age, gender, and lifestyle influence the prevalence of

metabolic syndrome and its components (**Cameron et al., 2004**). In several studies, the incidences of metabolic syndrome among postmenopausal women were found to be increased in the world (**Royer et al., 2007**).

The underlying mechanisms of metabolic syndrome are interwoven and difficult to delineate. However, it was suggested that obesity, improper dietary habits and sedentary life style are the roots of the metabolic syndrome (**Grundy, 2008**). Excess accumulation of body fat and particularly in the viscera might trigger inflammation, insulin insensitivity, dyslipidemia, and hypertension (**Bergman et al., 2006**).

Parulkar et al. (2001) reported that insulin resistance could lead to dyslipidemia that might be initiated by the resistance of adipocytes to the effects of insulin. The inability of insulin resistant fat cells to store the triglycerides could result in their hydrolysis and release of fatty acids, when being available, the increased hepatic synthesis of triglycerides and VLDL would occur. In addition, inflammatory markers decrease insulin sensitivity by causing dysfunction of insulin receptors substrate-1 (IRS- 1) and insulin receptors substrate-2 (IRS-2), decreasing glucose uptake and consequently increasing the dependence on lipid metabolism, thus creating a vicious circle (**Varman et al., 2004**). Moreover, peroxidation of blood LDL-
