# **STATEMENT**

This thesis is submitted to Ain Shams University, Cairo, Egypt, on August 2012 for the degree of Master of Science in Civil Engineering (Structural Engineering).

No part of this thesis has been submitted for a degree or a qualification to any other University or Institute.

Date : 01/ 09/2012

## APPROVAL SHEET

Thesis : Master of Science in Civil Engineering (Structural Engineering)

Student Name: Amal Mohamed Kamel Elawady

Thesis Title: Structural Performance of High-Rise  
Buildings with Transfer Floors

### **Examiners Committee: Signature**

#### **Prof. Dr. Mashhour Ahmed Ghoneim**

Professor of Structural Engineering Department,  
Faculty of Engineering, Cairo University

#### **Prof. Dr. Abdelraheem Khalil Dessouki**

Professor of Structural Engineering Department,  
Faculty of Engineering, Ain Shams University

#### **Prof. Dr. Ezzeldin Yazeed Sayed Ahmed**

Professor of Structural Engineering Department,  
Faculty of Engineering, Ain Shams University

#### **Prof. Dr. Amr Ali Abdelrahman**

Professor of Structural Engineering Department,  
Faculty of Engineering, Ain Shams University

Date: 01/ 09/2012

## **INFORMATION ABOUT THE RESEARCHER**

Name : Amal Mohamed Kamel Elawady

Date of Birth : April 16<sup>th</sup>, 1986

Place of Birth : Egypt

Qualifications : B.Sc. Degree in Civil Engineering (Structural  
Engineering) Faculty of Engineering, Ain Shams  
University (2008)

Present Job: Teaching Assistant, Ain Shams University

Signature :

## ACKNOWLEDGMENT

First of all, I would like to praise Allah for every gift bestowed on me.

I would also like to extend my warmest heartfelt gratitude to all my family especially to the soul of my father who stood by me and supported me in every step of my life. I would like to deeply thank my mother and convey my sincere appreciation for her assistance, encouragement, support, understanding, and patience; may Allah please her.

I would like to express my sincerest gratitude to my advisors, Prof. Ezzeldin Yazeed, Prof. Amr Ali Abdelrahman and Dr. Hussein Okail, for their continuous valuable guidance, their constant encouragement, support, and friendship; whom without their tutelage I would have never completed this thesis. I would like to express my admiration and thanks for their loyalty, trustfulness, persistence, understanding and kindness.

I am greatly indebted to all my colleagues who supported me especially Eng. Mohamed Abdel Aziz, and Eng. Mohamed Fawzy for their precious help.

I would like to acknowledge Dar Al Handasah consultants for their support and for providing helpful sources of scientific data.

Finally, there are no words that can express my sincere gratitude to the love of my siblings, friends, and my baby nephews; to them this thesis is dedicated. To my best friend who was always there by my side, to Mary.

Amal Mohamed Kamel Elawady

My youngest brother Ibrahim,  
We were dreaming together the  
best possible future for our  
country; but you left.

Completing this thesis  
prevented me from being by  
your side in your final days.

I hope your immaculate soul  
accept this apology:I hope  
you will forgive me.

*To The Souls of My Father and My  
Brother Ibrahim*

*To My Patient Mother*

## **STRUCTURAL PERFORMANCE OF HIGH RISE BUILDINGS WITH TRANSFER FLOORS**

### **ABSTRACT**

Structures with transfer floors redistribute the loads from the lateral resisting system above it to a wider-spaced system below. This system is widely used in many multi-purpose high-rise buildings which are constructed in densely populated areas.

An analytical investigation for the seismic response of high-rise buildings with transfer floors is performed in this research. A number of prototype models are analyzed using elastic response spectrum and nonlinear time history analysis techniques. Three-dimensional finite element models are adopted in the analyses. The analyzed models compare two different transfer floor systems: transfer plates and transfer girders. The vertical position of each transfer system with respect to the building height, are varied in these models. Four different building heights are considered which cover the range of medium- to high-rise buildings. Global seismic response of the building such as story shear distribution, bending moment distribution, inter-story drift, floor displacements and accelerations are numerically scrutinized.

The results presented in the research show damage localization in the vicinity of the transfer floor. Furthermore, it is evident from these results that the location of the transfer floor influences the overall seismic response of the structure. The numerical analyses also reveal that the transfer girders system is a competitive alternative to the slab transfer system: reduced seismic weights at the transfer floor level as well as less material cost with slight change in the global seismic behavior of the building are obtained via transfer girder system. Transfer girder system is

more flexible than slab type and yields reduced straining actions on the structural vertical walls.
