

Arthroscopic Assisted Management of Tibial Plateau fractures

(Schatzker Grade I, II, III)

Thesis

*Submitted for Partial Fulfillment
of M.D. degree in
Orthopedic Surgery*

BY: Sabry Mohammed Helmy Ragab
(M.B.B.ch., M.Sc.Orthopedics)

Under supervision of :

Prof. Dr.: Ahmed Ahmed Nabway Morrah
*Professor of Orthopedic Surgery
Faculty of Medicine
Cairo University*

Prof. Dr.: Khaled Abdel Salam Shohayeb
*Professor of Orthopedic Surgery
Faculty of Medicine
Cairo University*

Prof. Dr.: Hisham Misbah Soliman
*Professor of Orthopedic Surgery
Faculty of Medicine
Cairo University*

*Faculty of Medicine
Cairo University
2014*

Abstract

Minimally invasive surgical techniques have gained popularity over the recent years and try to prevent additional surgical trauma to the knee joint by using a minimally invasive approach. These surgical techniques fall in between the management of unstable tibial plateau fractures by plaster cast immobilization (higher risks of stiffness and deep venous thrombosis) and the traditional form of open reduction and internal fixation. The combined arthroscopic and radioscopy surgical treatment, initially used in the 1970s as a diagnostic tool and later as a standardized method of treatment, minimizes the additional surgical trauma, reducing additional insult to the soft tissues, and encounters several advantages compared with other techniques.

Acknowledgement

In the name of *Allah*, the all merciful. Thank you Allah for showing me the way, giving me the strength, and helping me to finish this work I beg your mightiness to forgive my mistakes you are the all forgiver and the ever merciful.

I'm deeply indebted to *Prof. Dr. Ahmed Ahmed Morrah*, Professor of orthopedic surgery, Faculty of Medicine. Cairo University, for his meticulous extensive revision of this work, his kind encouragement and support.

I'm deeply indebted to *Prof. Dr. Khaled Abdel Salam Shohayeb*, Professor of Orthopedic Surgery, Faculty of Medicine. Cairo University, for his great efforts with me and his tremendous knowledge he conveyed to me.

I wish to express my thanks appreciation to *Prof. Dr. Hisham Misbah Soliman*, Professor of Orthopedic Surgery, Faculty of Medicine. Cairo University, for his kind guidance, his valuable notes that sharpened this work, and for his sincere efforts in revising and polishing this work.

I am indebted to my family, my friends and colleagues who helped and supported me a lot during the course of this work.

Sabry Mohammed Helmy Ragab

Introduction

INTRODUCTION

Like other intra-articular fractures, the tibial plateau fracture is challenging for orthopedic surgeons because of its severity and associated soft tissue injuries. Although tibial plateau fractures comprise only 1% of all fractures, the displaced fractures, and the associated injuries, can cause severe consequences if not properly treated.⁽¹⁾ Non-operative management has historically been the preferred treatment for such fractures.⁽²⁾ However, to avoid prolonged immobilization and unstable reduction, surgical treatment is now the preferred treatment for displaced fractures. In any case, successful results depend on the quality of reduction, ligament stability, treatment of associated soft tissue injuries, and preservation of the soft tissue envelope. Additionally, good visualization of the articular surface with minimal dissection can help to achieve this goal^(3,4). Previous surgical methods achieved satisfactory results in only 70–80% of cases. Unfortunately, they also have a high incidence of complications including loss of reduction, pin tract infections, deep infection, and septic arthritis.⁽³⁾ Surgical treatment has evolved, and arthroscopy assisted minimal invasive surgery is now the attractive option among available surgical treatments⁽¹⁾.

The advantages of arthroscopic reduction and internal fixation for tibial plateau fractures are direct visualization of intra-articular fractures, accurate fracture reduction, reduced morbidity in comparison with arthrotomy, simplified diagnosis and treatment of
