2018

ACKNOWLEDGEMENT

First and foremost thanks are due to **ALLAH** the beneficent and merciful of all.

I would like to express my deep gratitude and appreciation to **Dr. Prof. Randa Kamal Abdel Raouf** *Professor of Pediatrics Department of medical studies, Institute of postgraduate childhood studies, Ain Shams University*, for her continuous help and unlimited support.

I am greatly indebted and grateful to **Dr. Ahmad Darwish Mohamad** *Lecturer of pediatrics, Faculty of Medicine - Mansoura University*, for his continuous encouragement to bring this work to the attempted goal.

I'm also thankful to **Dr. Ziyad Mohamed Essam Eldin Tawhid** *Lecturer of clinical pathology, Faculty of Medicine - Mansoura University*, for his help and advice.

I'm also thankful to **Dr. Prof. Mohamed Sarhan** *Professor of pediatrics, Faculty of Medicine- Mansoura University*, for his his continuous encouragement and support.

Amira Ahmed Nazim

الملخص العربي	1

List of Abbreviations

AIEOP	Associazione Italiana di Ematologia e Oncologia Pediatrica
ALC	Absolute lymphocyte count
ALPS	Autoimmune lymphoproliferative syndrome
ANA	Anti-nuclear antibody
ANOVA	Analysis of variance
Bregs	Regulatory B cells
CagA	Cytotoxin associated gene A
CBC	Complete Blood Count
CVID	Common variable immunodeficiency
DTap	Diphtheria Tetanus Pertussis Vaccine
EDTA	Ethylenediaminetetraacetic acid
ELISA	Enzyme Linked Immunosorbent Assay
FCIA	Flow Cytometric Immunobead assay
Hb	Hemoglobin
HCV	Hepatitis C virus
HIV	Human immunodeficiency virus
ICIS	Intercontinental cooperative ITP study group

ITAMs	Immunoreceptor tyrosine-based activation motifs
ITIM	Immunoreceptor tyrosine-based inhibitory motif
ITP	Immune thrombocytopenia
IVIG	Intravenous immunoglobulin
IWG	International Working Group
JAK	Janus kinase
KIR	Killer cell immunoglobulin-like receptor
LS	Laparoscopic splenectomy
MAP	Mitogen-activated protein
MMR	Measles Mumps Rubella Vaccine
MPV	Mean platelet volume
OD	Optical densit
PARC-ITP	Pediatric and Adult Registry of Chronic ITP
RAISE	Randomized Placebo- Controlled ITP Study with Eltrombopag
RITP	Refractory idiopathic thrombocytopenic purpura
RPM	Revolutions per minute
SDMP	Standard-Dose Methylprednisolone

SPSS	Statistical package for social science
STAT	Signal transducers and activators of transcription
TLC	Total leukocyte count
Tregs	Regulatory T cells
WASP	Wiskott-Aldrich syndrome protein
WBCs	White blood cell

44	Correlation between PLT after 1 year and AB for the three groups of the study	112
45	Correlation between age in `years and PLT after 1 year for the three groups of the study	113

INTRODUCTION

The term ITP refers to “immune thrombocytopenic purpura,” “idiopathic thrombocytopenic purpura,” and, most recently, “immune thrombocytopenia” (*Ruggeri et al., 2008*).

ITP is an autoimmune disease characterized by a decreased platelet count (less than $100 \times 10^9/L$) due to destruction of antibody-sensitized platelets in the reticuloendothelial system (RES) (*Blanchette and Bolton-Maggs, 2010, Lanzkowsky, 2011*).

Primary ITP is isolated thrombocytopenia (platelet count $< 100 \times 10^9/L$) in the absence of disorders or other causes that may be presented with thrombocytopenia (*Semple et al., 2010*).

Secondary ITP is any form of immune disease causing thrombocytopenia except primary; such as systemic lupus erythematosus (SLE), infection with hepatitis C or lymphoproliferative disease (*Lanzkowsky, 2011*).

The term “newly-diagnosed ITP” now replaces the old term “acute ITP”, which is any ITP diagnosed within the preceding 3 months. Persistent ITP refers to immune thrombocytopenia of 3-12 months duration, while immune thrombocytopenia more than 12 months duration is referred to chronic ITP (*Semple et al., 2010, Lanzkowsky, 2011*).

Primary ITP is a diagnosis of exclusion by carefully ruling out causes of pseudo thrombocytopenia, secondary ITP, and inherited ITP. Obtaining an accurate history combined with a complete blood count is the first and most important step. The diagnosis of ITP is based up on the following criteria:

- Acute onset of bruising and petechiae in an otherwise healthy child-often with a recent history of viral infection.
- Platelet count $<100,000 \times 10^9/L$ (often $<20,000 \times 10^9/L$).
- Otherwise normal complete blood count (CBC) with differential white count, and reticulocyte count.
- No abnormalities on the peripheral blood smear after review by an experienced practitioner. In particular, there should be no evidence of hemolysis or of blast cells.
- No clinically apparent associated conditions that may cause thrombocytopenia, after a thorough history and physical examination. Findings that suggest a diagnosis other than ITP include enlargement of lymph nodes, liver, spleen or systemic symptoms (e.g., fever, anorexia, bone or joint pain, or weight loss) (*Rodeghiero et al., 2009*).

The majority of children with acute ITP will require only advice, support and repeat CBC 10 days after diagnosis to ensure that there is no generalized marrow disorder. Further monitoring of the CBC is not required unless a change in the child's condition takes place to suggest that remission has occurred, or that deterioration has taken place.

Any of the following may be used in a special setting if it is thought that the clinical condition requires that the platelet count should be raised : (prednisone, intravenous immunoglobulin, IV anti-D immunoglobulin).

The majority of children achieve spontaneous remission and do not suffer major bleeding complications despite a platelet count $<10 \times 10^9/L$.

The expectant ‘watch and wait’ policy of management is recommended for such patients. In the absence of ‘wet bleeding’, the child does not require hospitalization. The frequency of follow up blood counts should be limited to every 1-2 weeks initially and lesser thereafter, in order to avoid unnecessary hospital visits and anxiety (*Imbach et al., 2006*).

Anti-D may be considered for first-line therapy in Rh + non splenectomized children (*Neunert et al., 2011*).

Definition of study concepts:

ITP: it is an autoimmune disorder characterized by immunologic destruction of otherwise normal platelets most commonly occurring in response to an unknown stimulus.

Primary ITP: is a platelet count less than $100 \times 10^9/L$ in the absence of other causes or disorders that may be associated with thrombocytopenia.

Mean platelet volume (MPV): is a measure of platelet size.

A viral prodroma: is defined as a documented history of upper respiratory tract illness (URI), gastrointestinal (GI) symptoms, or skin exanthema within 4 weeks of diagnosis of ITP.

Pseudo thrombocytopenia: is the result of platelets clumping in the presence of ethylenediaminetetraacetic acid (EDTA).
