Note

The present thesis is submitted to the Faculty of Science, Ain Shams University in partial fulfillment for the requirements of the Master degree of Science in Geophysics.

Beside the research work materialized in this thesis, the candidate has attended ten post-graduate courses for one year in the following topics:

- 1) Geophysical field measurements.
- 2) Numerical analysis and computer programming.
- 3) Magnetic method.
- 4) Gravity methods.
- 5) Electromagnetic methods.
- 6) Radiometric methods
- 7) Electrical methods.
- 8) Geophysical exploration.
- 9) The shape of the earth.
- 10) Plate Tectonics.

He successfully passed the final examinations in these courses.

In fulfillment of the language requirement of the degree, he also passed the final examination of a course in the English language.

Head of Geophysics Department

Prof. Dr. Samy Hamed Abdel Nabi.

ACKNOWLEDGEMENTS

My great debt and sincere gratitude is due to the Almighty **Allah**, who in his infinite mercy and wisdom, made the completion of this thesis possible. I dedicate this thesis to **my father** and his memory with all love and respect. This thesis is dedicated to **my mother** for her kindness and devotion, and for her endless support. Also, thesis is dedicated in honor to my husband **Walid** for the great motivation and inspiration. I dedicate this work to my lovely son **Adam**, wishing him a very happy life. I also dedicate this research to my brothers **Abdullah** and **Farouk** who have supported me and taking care of me throughout all my educational stages.

I would like to especially appreciative to **Dr/ Salah El Din Abdel Wahab, Dr/ Samy Hamed Abdel Nabi & Dr. Atef Ali Mahmoud Ismail**, for their continuous help, fruitful discussion and criticism as well as for their guidance and supervision of this study , and I am very thankful as they were always available to discuss any technical challenges I encountered.

My sincere thanks to **Prof. Dr. Alaa Eldin Ahmed Fahmy Aref**, Vice Head of Exploration Division, Nuclear Material Authority (NMA), Cairo, Egypt. He really did a lot of work providing help, research materials and lots of his precious time.

Special thanks to my colleagues **Ahmed** and **Asmaa** for their help and valuable advice throughout the stages of the thesis. Also deep thanks to my aunt **Hoda** and to my colleague **Ms. Enaam** for their encouragement and support through research stages of thesis.

My grateful Thanks to all the staff of airborne geophysics department specially Dr/ Ali Mohammed Mustafa , Osama. Z, Tamer. Deep thanks are also to my colleagues, Airborne Geophysics Department Staff members, Sayed, Ms. Salwa, , Rehab, Essam, Emad, Ahmed Hamdi, Ramadan for their assistance during the work.

Finally, this thesis is dedicated to all those who believe in the richness of learning.

ABSTRACT

The study area is located at 120 km at the west of the Dakhla Oasis, Central Western Desert of Egypt. The study area of this survey is bounded by latitudes $25^{\circ} 23' 55''$ and $26^{\circ} 31' 16''$ N and longitudes $26^{\circ} 15' 24''$ and $27^{\circ} 30' 9''$. The sedimentary rocks occupy most of the study area and ranging from Jurassic age to Quaternary.

In Sep 24, 2014, Airborne Geophysics Department (AGD) of the Nuclear Materials Authority conducted a high resolution multi-channel gamma-ray spectrometric and magnetic survey covering an area of approximately 19,625 km² with 29,540 line kilometer over West Dakhla area, Central Western Desert, Egypt. The data were acquired along flight lines oriented in N-S direction using 4000 m line spacing and along tie lines oriented in E-W direction using 10000 m line spacing. Nominal flying elevation was used to be 100 m above ground floor.

The aim and purpose of this study is to analysis and interpret the airborne magnetic and spectrometric data for geologic mapping, locating the radioactive element anomalies. Application of composite image technique has been developed to interpret qualitatively airborne gamma - ray spectrometric survey data. The integrated results gained from these methods are illustrated in the interpreted radiometric lithologic unit map (IRLU) . The airborne magnetic data obtained from the survey over the study area has been analyzed by various techniques such as the reduction to the north magnetic pole (RTP), isolation of the regional and residual magnetic components using Gaussian filtering technique, calculation of the magnetic depth calculation. The integration of all these

techniques has been resulted in the construction of the interpreted magnetic basement tectonic map for the study area.

Three techniques of magnetic depth calculation were applied in the study area. The depth maps show that results are much closed to each other. These methods are the Source Parameter Image (SPI), Analytic Signal (AS) and Euler method.

The basement tectonic shows that the main affected system is NW -SE. Tectonic map also shows that there are another systems affect the area in NE-SW, E-W and NNE-SSW trends. Magnetic modelling profiles were constructed to confirm the interpreted basement structural relief of the study area.

These maps of the depths help us very much in delineating the general structures of basement surface. To confirm the interpreted magnetic basement tectonic framework of the studied area, a magnetic profile was modeled using three 2D- modeling technique. Close examination of this profile shows an excellent fit between the observed and calculated anomalies with an errors reach 0.942 nT, 0.837 nT and 0.891 nT .
