بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قَالَ

لَسْبَحَانَكَ لَا عِلْمَ لَنَا  
إِلَّا مَا عَلَّمْتَنَا إِنَّكَ أَنْتَ  
الْعَلِيمُ الْعَظِيمُ

صدق الله العظيم

سورة البقرة الآية: ٣٢

# Acknowledgement

*First and foremost thanks to **ALLAH**, the Most Merciful.*

*I wish to express my deep appreciation and sincere gratitude to **Prof. Dr. Abeer Abdel Maksoud Hafez**, Professor of Diagnostic Radiology, Ain Shams University, for her close supervision, valuable instructions, continuous help, patience, advices and guidance. She has generously devoted much of her time and effort for planning and supervision of this study. It was a great honor to me to work under his direct supervision.*

*I wish to express my great thanks and gratitude to **Prof. Dr. Samer Malak Botros**, Professor of Diagnostic radiology, Ain Shams University, for his kind supervision, indispensable advice and great help in this work.*

*I wish to express my great thanks and gratitude to **Dr. Merhan Ahmed Nasr**, Lecturer of Radiodiagnosis, Ain Shams University, for her kind supervision, indispensable advice and great help in this work.*

*Last and not least, I want to thank all my family, my colleagues,, for their valuable help and support.*

*Finally I would present all my appreciations to my patients without them, this work could not have been completed.*

## ABSTRACT

**Background:** Colorectal cancer (CRC) is one of the most common malignancies worldwide and is a major health problem in developed countries with local and distant recurrences develops in 30-50% of patients during follow-up after primary surgery. **Aim of the Work:** The present study is aiming at emphasizing the role of PET/CT in follow up of patients with colorectal carcinoma after treatment, as well as detection of local recurrence and distant metastasis. **Methods:** the study included 25 patients with past history of colorectal cancer, they underwent PET/CT examination with the following protocol: patients were fasting for at least 6 hrs before undergoing scanning. A standard dose of 1-1.5 mCi/kg of F-FDG was intravenously injected 45-60 mins before imaging then initially low dose CT was performed for attenuation correction. After that PET emission scanning was performed immediately after the CT. this was followed by diagnostic CT using IV contrast administration and hyperosmolar oral contrast (diluted mannitol solution) to achieve bowel distension. All data acquired a combined PET/CT in-line system. **Results:** The study showed that there is significant paired differences between the number of local lesions as well as metastatic deposition detected in the initial and follow up PET/CT. **Conclusion:** FDG PET/CT is extremely useful for therapy response assessment due to its capacity to help distinguish between residual metabolically active tumor and areas of necrosis and fibrosis, thus identifying which of these patients have achieved satisfactory functional remission and which one of them needs further treatment.

**Keywords:** CRC: Colorectal cancer; PET: Positron emission tomography; CEA; Carcino embryonic antigen

## INTRODUCTION

Colorectal cancer (CRC) is one of the most common malignancies worldwide and is a major health problem in developed countries with local and distant recurrences develops in 30–50% of patients during follow-up after primary surgery. (*Wichmann et al., 2015*)

Colorectal imaging advances with magnetic resonance (MR), CT colonography (CTC), and positron emission tomography (PET) over the past year or so have been substantial. (*Perry, 2015*)

<sup>18</sup>F-fluorodeoxyglucose (FDG) PET/CT is well established as a diagnostic tool in the evaluation of patients with rising Carcino embryonic antigen (CEA) and suspected recurrence of colorectal cancer. (*Lu, et al., 2013*)

The early detection of recurrence is vital because surgery, radiotherapy and chemotherapy (either separately or as part of a multidisciplinary approach) may improve patient survival and quality of life. Although only 20–30% of patients with recurrent metastatic disease are suitable candidates for curative resection, the five-year survival rate in this group is 30–40%. (*Elias et al., 2014*).
