Title of Thesis:

Phasor Measurement Unit Based Wide Area Backup Protection Scheme for
Transmission Lines

Key Words:

Transmission Line Fault Location, Phasor Measurement Unit, Wide Area Backup
Protection, Cross-country Faults.

Summary:

This thesis proposes an innovative wide area backup protection scheme for untransposed single- or double-circuit transmission lines that can be applied as a substitute for third zone function of distance relay. The proposed scheme is derived based on the transmission line theory and Taylor series expansion of distributed line model parameters taking into account the effect of mutual couplings between the adjacent circuits. For large power network, a binary integer linear programming is utilized for determining the minimal number of PMUs to obtain complete fault observability. Synchronized voltage and current measurements obtained from PMUs are utilized for fault detection, faulty line identification, and fault location. Extensive simulation studies are applied to three-terminal untransposed double-circuit transmission lines and New England 39-bus test system and the simulation results prove that the proposed scheme yields acceptable performance for all simulated cases.

Disclaimer

I hereby declare that this thesis is my own original work and that no part of it has been submitted for a degree qualification at any other university or institute.

I further declare that I have appropriately acknowledged all sources used and have cited them in the reference section.

Acknowledgments

All praises and thanks to Allah for guiding me to complete this dissertation by providing me with very valuable persons to support me during my work.

I thank Allah and my supervisors Prof. Hany Elghazaly and Dr. Ahmed Emam for their encouragement, helpful advice and the time they offered me during research period.

Finally, my thanks to my family for their encouragement, support, and patience all the time in order to complete my thesis in its best form.
