## ACKNOWLEDGEMENT

Thanks to **ALLAH** for helping me to achieve this work.

I would like to express my sincere gratitude and thanks to **Pro. Dr. MOHAMED OSMAN RABIE** Prof. of Neuropsychiatry, Faculty of Medicine, Tanta University, for proposing the subject, his kind support and useful advice drawn from his fund of wide experience.

I wish to express my deepest thanks and sincere appreciation to **Prof. Dr. WAGEH MAHMOUD AWARA** Prof. of Pharmacology, Faculty of Pharmacy, Tanta University, for his valuable guidance, unlimited encouragement, the time and effort he generously gave me.

I am gratefully thankful to **Prof. Dr. AHMED ABDEL AZIEM MENAISY** Prof. of Pathology, Faculty of Medicine, Tanta University, for his kind support and useful advice.

My wholehearted gratitude to **Dr. WAEL AHMED FADEL ABD EL-RAHMAN** Ass. Prof. of Neuropsychiatry, Faculty of Medicine, Tanta University, for suggesting and planning the presenting study and for giving me his time and energy.

To all the staff members of Neuropsychiatry Department Tanta Faculty of Medicine, I wish to express my deep thanks

Finally, I would like to extend my greatest appreciation to my family for their continuous help and encouragement during performing this work.

## ***ABBREVIATIONS***

<b>ACDs</b>	=	Anticonvulsant drugs
<b>AEDs</b>	=	Antiepileptic drugs
<b>CA</b>	=	Catalase
<b>CBZ</b>	=	Carbamazepine
<b>cGMP</b>	=	Cyclic guanosine monophosphate
<b>CNS</b>	=	Central nervous system
<b>Freq</b>	=	Frequent
<b>FRs</b>	=	Free radicals
<b>FRSEs</b>	=	Free Radical Scavenging Enzymes
<b>GABA</b>	=	Gamma-aminobutyric acid
<b>GPX</b>	=	Glutathione peroxidase
<b>GR</b>	=	Glutathione reductase
<b>GSH</b>	=	Glutathione
<b>GTCS</b>	=	Generalized tonic clonic seizure
<b>H<sub>2</sub>O<sub>2</sub></b>	=	Hydrogen peroxide
<b>HO<sup>•</sup></b>	=	Hydroxyl radical
<b>i.c.v.</b>	=	Intracerebroventricular
<b>Infreq</b>	=	Infrequent
<b>i.p.</b>	=	Intraperitoneal
<b>L- NAME</b>	=	L-nitroamine mono-methyl ester
<b>LPO</b>	=	Lipid peroxidation
<b>MDA</b>	=	Malondialdehyde
<b>NMDA</b>	=	N-Methyl-D-Aspartate
<b>NO</b>	=	Nitric oxide
<b>Mono</b>	=	Monotherapy
<b>NOS</b>	=	Nitric oxide synthase
<b>O<sub>2</sub><sup>•-</sup></b>	=	Superoxide
<b>ONOO<sup>-</sup></b>	=	Peroxynitrite
<b>PB</b>	=	Phenobarbitone
<b>PHT</b>	=	Phenytoin
<b>Poly</b>	=	Polytherapy
<b>ROS</b>	=	Reactive oxygen species
<b>SOD</b>	=	Superoxide dismutase
<b>Unmed</b>	=	Unmedicated
<b>VPA</b>	=	Valproate

## INTRODUCTION

## INTRODUCTION

Epilepsy is, unquestionably, one of the commonest neurological disorders. The mechanism of epileptogenesis is not clearly established (Kurekci *et al.*, 1995).

In 1988, Davison *et al.*, postulated that there is a role for free radicals in numerous neurological disorders. As the brain contains large amount of lipid in myelin sheaths, it is considered as a logical target of free radicals damage (Choi, 1993). Thus, the hypothesis that free radicals are involved in the pathogenesis of certain central nervous system (CNS) diseases, has gained increasing popularity in recent years (Choi, 1993).

Free radicals have been postulated to contribute in neuronal loss in cerebral ischemia (Demopoulos *et al.*, 1980), seizures disorders (Lange *et al.*, 1980; Torbati *et al.*, 1992), schizophrenia (Cadet, 1988), aging (Harmon, 1987; Pryor, 1987), Parkinson's disease (Yoshikawa, 1993; Youdim and Lavie, 1994), and Alzheimer disease (Richardson *et al.*, 1990).

Free radicals are generated from the electromagnetic excitation of molecular oxygen, degradation of reactive oxygen species, atmospheric pollutants, such as nitric and nitrous oxide, and from non oxygen containing compounds, such as carbon tetrachloride or chloroform (Bonorden and Pariza, 1994).

Free radicals of oxygen are generated during many normal biochemical reactions in living tissues. The unpaired electron makes these compounds highly reactive. They can initiate disruptive peroxidation reactions with proteins, lipids and nucleic acid, which are important to the survival of cells. A fairly complex defense system has evolved to minimize

the damage that might occur (*Jesberger and Richardson, 1991; Bonorden and Pariza, 1994*).

Antioxidants play an important role in protecting the body from an oxidative insult by peroxides, hydroxyl radicals and superoxide anion radicals. The principle antioxidant present in human blood are urate, vitamins C and E, superoxide dismutase (SOD) and protein particularly ceruloplasmin, albumin and lactoferrin. Intracellularly there are in addition the enzymes SOD, glutathione peroxidase, catalase and methionine sulfoxide reductase (*Halliwell and Gutteridge, 1989*).

The lipid peroxidation of cell membrane, due to increase in free radicals or decrease in activities of antioxidant defense mechanisms, has been suggested to play a role in the pathogenesis of different types of epilepsy as well as in the increased incidence of recurrence of seizures (*Willmore, 1990; Abbott et al., 1990*).

It has been suggested that part of the effectiveness of antiepileptic drugs (AEDs) is due to influencing free radical generating systems. An excessive free radicals production was found in epileptic patients under treatment with AEDs. More complex changes were seen in polytherapeutic combination (*Maertens et al., 1995*).

Oxidative stress (free radical generation exceeds antioxidant defense) occur in many diseases. Phenytoin (PHT) is known to initiate oxidative damage to proteins and lipids in murine maternal hepatic and embryonic tissue organelles. There was a decrease in the total antioxidant capacity and elevation in lipid hydroperoxide concentration in sera of epileptic patients receiving PHT (*Mahie and Dasgugta, 1997*).

Glutathione peroxidase (GPX) and superoxide dismutase (SOD) are the most important members of antioxidant defense mechanisms.

Glutathione peroxidase was found to be increased in valproate medicated patients, while its level did not significantly changed in carbamazepine medicated patients (*Kurekci et al., 1995*).

Nitric oxide (NO) was found to play many roles in CNS as a messenger molecule, however when generated in excess, it can be neurotoxic. It is likely that most of the neurotoxic actions of NO are mediated by peroxynitrite, which is the reaction product of NO and superoxide anion (*Dawson and Dawson, 1996*).

Nitric oxide is thought to be a transynaptic retrograde messenger involved in modulating neuronal activity, but its function in relation to N-Methyl-D-Aspartate (NMDA) receptor activation is controversial (*Theard et al., 1995*). *De Sarro et al (1991)* showed that inhibition of NO has a protective effect against NMDA -induced seizure. On the other hand *Buissen et al (1993)*, reported that NO which is produced in response to NMDA receptor activation, leads to seizure activity termination.

There are some indications that the neuronal cell damage in human epilepsy may be caused by seizure (*Mouritzen, 1980*), and is sometimes associated with functional impairment, such as memory loss (*Lenz et al., 1992*). So the ideal antiepileptic drug is that which not only to prevent seizures, but also to protect against the neuronal damage possibly associated with appearance of seizures (*Pitkanen and Halonen, 1995*).

*Thompson et al (1996)* concluded that NMDA receptor activation is not solely responsible for the neuronal pathology as a consequence of epileptiform discharge. On the other hand, *Glass and Dragunow (1995)* stated that no single chemical abnormality or morphological alteration is going to explain the clinically diverse disorder of epilepsy.

## AIM OF THE WORK
