Approval Sheet

**Structural Analysis and Petrophysical Evaluation
of the Cretaceous Rocks, Shushan Basin , Western
Desert, Egypt.**

By

Nancy Hamdy Sayed El Dally
B. Sc. in Geology, Helwan University, 2005

A Thesis Submitted for Master DEGREE of science in Geology
(Structural Geology)

To

Geology Department
Faculty of science
Ain Shams University

Supervisors:

Prof. Dr. Mahmoud Samy Mohamed Yousif
Professor of Structural Geology
Geology Department, Faculty of Science
Ain Shams University

Prof. Dr. Ahmed Sayed Ahmed Abu El Ata
Professor of Applied Geophysics
Geophysics Department, Faculty of Science
Ain Shams University

Prof. Dr. Ali Farag Sayed Osman
Head of the Geology Department
Faculty of Science, Ain Shams University

Ain Shams UNIVERSITY

FACULTY OF SCIENCE

GEOLOGY DEPARTMENT

Note :

The present thesis is submitted to the Faculty of Science, Ain Shams University in partial fulfillment for the requirements of the degree of Master of Science in geology. Besides the research work materialized in this thesis, the candidate has attended ten post-graduate courses for one year in the following topics

1. Advanced Structural Geology
2. Geotectonics
3. Sequence Stratigraphy
4. Biostratigraphy
5. Photogeology
6. Geomorphology
7. Sedimentation
8. Sedimentary Petrology
9. Field Geology
10. Geostatistics

He successfully passed the final examination in these courses.

In fulfillment of the language requirement of the degree, he also passed the final examination of a course in the English language.

Prof. Dr. Ali Farag Sayed Osman

Head of the Geology Department

Faculty of Science, Ain Shams University

ACKNOWLEDGMENT

First and above all, I would like to express my great thanks to "**ALLAH**" who supplied me with strength and patience to complete this work. "**Thanks Allah**".

I would like to express my sincere gratitude and express my great appreciation to my academic supervisor **Prof. Dr. Mahmoud Samy M. Yousif** Prof. of Structural, Geology Department, Faculty of Science, Ain Shams University for proposing the present research topic, helpful advice and permanent support. He gave me a lot of his precious time during his supervision.

Also would like to thank **Prof. Dr. Ahmed Sayed Ahmed Abu El Ata** Prof. of Applied Geophysics Geology Department, Faculty of Science, Ain Shams University for the help, time, and technical knowledge and materials. His door was always open to me, even when he had piles of work. We worked together with ease and enjoyment.

A special word of gratitude is due to **Prof. Dr. Ali Farag** Head of Geology Department, Faculty of Science, Ain Shams University for his constant encouragement and fruitful and interesting discussions throughout this work.

I really appreciate **Prof. Dr. Farouk Ibrahim A. Metwalli**, Professor of Exploration Geophysics, Helwan University for his help and technical support throughout this work. I am extremely lucky to have such a great man in my life. His support and unflinching care will remain in my heart forever. He gave me so much of his time and efforts. Thank you for being in my life.

Special thanks to **Prof. Dr. Ali Mohamed Ali**, Head of Structural Geology division for his helpful advice and encouragement during seminar presentation.

I am also appreciate **Prof. Dr. Adel Ramadan Moustafa**, Professor of Structural Geology, Geology Department, Ain Shams University for his technical comments during seminar presentation.

Thanks also for the **Egyptian General Petroleum Cooperation (EGPC) and Khalda Petroleum Company** for permitting me to use the data for the thesis. Finally, I would like to thank my family for their patience and support.

ABSTRACT

The present study deals with evaluation of the Surface and Subsurface structural framework and reservoir characteristics. This is to evaluate the hydrocarbon potentialities of the study area Qasr oil Field (Shushan basin) which is located at the north Western Desert of Egypt, about 7.5 Km south of the Mediterranean coast.

The data include 2D and 3D seismic data, composite logs, electrical logs, cores and plugs results from the available exploration wells were utilized in this study. The AEB-3D rock unit is a part of the Lower Cretaceous Alam El Bueib Formation, and is considered as the main oil producing reservoir in the study area. The Lower Cretaceous Alam El Bueib sand (AEB) was interpreted, as stacked channel and point bar fluvio-deltaic sands, with interbedded shales and some limestones or dolomites. The oil is trapped in stratigraphic or structural three-way dip closures or a combination of both.

This work aims to find new drilling sites for further field development in the future, where the reservoir compartmentalization model can be updated, based on the data available from new wells. Furthermore, the analysis of electric well logs, reservoir pressure measurements and sedimentological core descriptions can help in the detection of sand channels and to predict their directions. Lithological interpretation showed two sand zones, with average thickness of 30-50 ft. in most wells. They are separated by inter-zones layers of about 10-50 ft. (distance). The interpretation of well logs, coupled with the core descriptions, showed that, Alam El Bueib-3D rock unit is subdivided laterally into two sand channels. Both are deposited in a high energy tidal environment. Well correlations, mapping and analysis of the pressure measurements showed that, the directions of these channels are most probably northeast to southwest. In addition, the effect of stratigraphy and structures led to a number of reservoir compartments with varying pressure values, either vertically or horizontally.

Picking and interpretation of the ten horizons from Lower Safa to Dabaa Formation which done by tying seismic data (time) with well data (depth). Seismic profiles illustrated the Surface and subsurface structural framework of the Lower Safa and Alam El Bueib reservoirs. It can be demonstrated that 3D structural modeling described the structural

compartments of the study area by displaying cross sections along any direction and through any well location of the model's data base. This can be used to propose locations for future exploration wells in the area.

Structurally, Qasr oil field is represented by horsts and grabens. Large accumulations of hydrocarbons have been trapped along the NE-SW elongated, narrow and asymmetrical tilted fault blocks.

The reservoir Petrophysics characteristics of the present study deals with the determination of the reservoir properties by using different log responses imply good reservoir quality. Petrophysical properties of Lower Safa and Alam El Buieb reservoirs are represented in the form of isoparametric maps which include shale volume (V_{sh}), gross sand, total porosity, effective porosity, water saturation (S_w), net pay, net/gross thickness, hydrocarbon saturation (S_h), residual hydrocarbon saturation (S_{hr}) and movable hydrocarbon saturation (S_{hm}) to show their horizontal distributions of the Lower Safa reservoir. The well log analysis of the Lower Safa and Alam El Buieb reservoirs using different types of the cross-plots such as density neutron that shows the Lower Safa reservoir is mainly sandstones with some calcareous cement. According to the pressure analysis, the hydrocarbon type of Lower Safa reservoir in Qasr oil Field field is mainly light hydrocarbon.

The source and reservoir rocks are all sandstones, while the seal rocks are the local intra-formational shales. The oil in sandstones is of 22-35 API. Porosity, permeability and water saturation ranges of the reservoir pay zones are 15-30%, 100-300 md and 20-50%, respectively

Data integration of all input data with each other by the Petrel TM , Schlumberger's software. The results of this study showed improve in the reservoir characterization of the Lower Safa and Alam El Buieb Formations, help to identify potential hydrocarbons present and hence will aid increasing the cumulative reserves in the concerning area. The integrated data has been used to support the exploration and development in the future field planning.
