

Sexual Dysfunction in A Sample of Female Patients with Obsessive Compulsive Disorder

Thesis

*Submitted for Partial Fulfillment Of the MD Degree
In psychiatry*

Presented by

Moatazbellah Ibrahim Mohamed Ali

*M.Sc. in Neuropsychiatry
Faculty of Medicine - Ain Shams University*

Supervised by

Prof. Ahmed Saad Ali

*Professor of Neuropsychiatry
Faculty of Medicine- Ain Shams University*

Prof. Mohamed Fekry Abd El Aziz

*Professor of Neuropsychiatry
Faculty of Medicine- Ain Shams University*

Prof. Mona Medhat Reda

*Professor of Neuropsychiatry
Faculty of Childhood Post Graduate Studies, Ain Shams University*

Dr. Hussien Ahmed Elkholy

*Assist. Professor of Neuropsychiatry
Faculty of Medicine-Ain Shams University*

*Faculty of Medicine
Ain Shams University*

2019

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قَالَ

لَسْبَدَانِكَ لَا عِلْمَ لَنَا
إِلَّا مَا عَلَّمْتَنَا إِنَّكَ أَنْتَ
الْعَلِيمُ الْعَظِيمُ

صدق الله العظيم

سورة البقرة الآية: ٣٢

Acknowledgement

*First, I thank **God** for granting me the power to proceed and accomplish this work,*

*I wish to express my sincere and deepest gratitude to **Prof. Ahmed Saad** Professor of Psychiatry, Faculty of Medicine, Ain Shams University for continuous encouragement, valuable support and generous recommendation that enable me to accomplish this work,*

*I really wish to thank **Prof. Mohamed Fekry**, Professor of Psychiatry, Ain Shams University for his constructive criticism, faithful guidance and tremendous support*

*I am profoundly grateful to **Prof. Mona Reda**, professor of psychiatry, Ain Shams University for her choosing this interesting topic, meticulous revision of this work and for continuous guidance and support.*

*My sincere thanks and deep appreciation go to **Assit. Prof. Hussien Elkholy**, Professor of Neuropsychiatry Faculty of Childhood Post Graduate Studies, Ain Shams University for his sincere advice and kind cooperation in all steps of this work,*

I also wish to thank all my professors, colleagues and all staff members of Neuropsychiatry department, Faculty of Medicine, Ain Shams University for their encouragement and cooperation.

I also wish to thank my patients for participating and helping to complete this work,

INTRODUCTION

Sexuality has always been in the focus of interest and analysis to human beings from the days of cave paintings, anatomical illustrations and drawings of Leonardo da Vinci to the internet nowadays. Every person's sexual tendencies depend on four interrelated psychosexual factors: sexual identity, gender identity, sexual orientation and sexual behaviour. These factors influence the development, growth and personality of a person (*Kaplan and Sadock, 2014*).

Sexual function needs an interaction between anatomical, physiological, sociocultural, psychological factors, relationships with others, and developmental experiences throughout life (*American Psychiatric Association, 2013*).

Female sexuality problems can be a result of a complex interplay of biological, hormonal, and psychological factors that can have a significant negative effect on female sexual health and quality of life and can be influenced by several factors as advancing age, social factors, psychosocial stress, and trauma (*Kingsberg and Woodard, 2015*).

Female Sexual Dysfunction (FSD) takes different forms, including lack of sexual desire, impaired arousal, inability to achieve orgasm, or pain with sexual activity. It may be a lifelong problem or acquired later in life after a period of normal sexual life (*American Psychiatric Association, 2013*).

Obsessive-compulsive disorder (OCD) is one of the chronic disabling psychiatric disorders. It presents with obsessions and/or compulsions and affects badly the patient's quality of life (*Inanir et al., 2015*).

Obsessions include thoughts, feelings, images and urges. They are illogical, unwanted and silly. They waste time and interfere with the normal life, work, usual social activities or interpersonal relationships. Compulsion is a behavior that may be associated with obsessions trying to reduce the anxiety but does not always lead to reducing anxiety. Anxiety may remain unchanged or even increase. It is conscious and recurrent such as counting, checking, or avoiding (*Pepper et al., 2015*).

Many studies tried to find an association between OCD and sexual complaints. Patients with OCD suffered from multiple sexual problems but these problems had mainly been accounted for the effect of pharmacotherapy use for management of OCD on sexual function and impaired their sexual life and quality of life (*Inanir et al., 2015*).

Many reports found that patients with OCD did not prefer to marry or have sexual life or experience. Also, OCD patients may suffer from sexual dissatisfaction (*Steketee, 1997*). A Turkish study compared the level of sexual satisfaction in OCD and generalized anxiety disorder and found higher incidence of lack of orgasm, decreased sexual arousal and sexual avoidance in the OCD group (*Aksaray & Yelken, 2001*).

Other studies found that 62% of the patients had problems in sexual desire, 33% had orgasmic phase dysfunction, 29% had reduced sexual arousal, 25% had problems regarding physiological arousal and 10% had lack of sexual pleasure (*Vulink et al., 2006*).

There were conflicting reports in studies of sexual dysfunction in patients with OCD and most of them were uncontrolled and provided relatively limited evidence about sexual dysfunction in OCD (*Kendurkar & Kaur, 2008*).

Also, to our best knowledge there are not any studies or reports about the relation between OCD and sexual dysfunctions in Egypt.

HYPOTHESIS

There is a significant association between sexual dysfunctions and obsessive-compulsive disorder.

AIM OF THE WORK

- 1- To assess the rate of sexual dysfunctions in female patients with OCD
- 2- To compare between females diagnosed with OCD and control group regarding sexual dysfunctions.
- 3- To determine the relation between the content, duration and severity of OCD symptoms and sexual dysfunctions.

*Chapter 1***FEMALE SEXUALITY**

Sexuality is an important part of life and no one can obtain a healthy and satisfying life without sex. It is essential for wellbeing and quality of life for all people especially middle-aged women. Physical and emotional benefits like reduced risk of heart disease, improved self-esteem, and more can come from having sexual life (*Biddle et al., 2009*).

Women share men in many reasons to initiate or respond to sexual activity as sharing sexual excitement and physical pleasure and experiencing affection, love, romance, or intimacy. However, women need sex for other reasons as they need to be more emotionally close with their partners, to improve their self-confidence, to confirm their desirability and to please their partners for something (*Murtagh, 2010*).

Sexual identity development is related to an interaction between biological sex (being male or female), gender identity which is a psychological sense of being male or female, gender role that is a degree of adherence to social expectations for one's sex, sexual orientation which is defined as the direction and persistence of one's experiences of sexual attraction and intention or values framework (what one intends to do with the desires one has in light of one's beliefs and values) (*Althof, 2007*).

Female Sexual activities are mediated by the complex interaction of anatomical, physiological (hormonal, vascular, muscular, and neurological), sociocultural, psychological factors, relationships with others, and developmental experiences throughout life (*Reda et al., 2013*).

Exact Mechanisms about the development of healthy sexuality cannot be clearly found, but it is proven that it cannot be only sexual. It may depend on attachment styles to parents, the ability of caretakers to identify and satisfy the child's needs (*Zeuthen and Gammelgaard, 2010*).

Limbic system (especially medial amygdala, hippocampus, cingulate cortex, insular cortex, nucleus accumbens, stria terminalis and preoptic area) is essential for sexuality and plays a major role in the initiation of sexual desire and fantasies and their related sexual consequences as mental sexual arousal and the subsequent cascade of neurovascular events (somatic and genital responses) (*Solms and Turnbull, 2002*).

Many studies proved the role and involvement of the neocortex (parietal and frontal cortices) in the sexual response in humans (final pathway of different sensory smells, tastes, words, sights or touch stimuli). They can give the green signals to both the parietal sensory cortex and the limbic sexual cortex when the sensations are 'coded' as sexual. Cognitive factors are also in play in evaluating the sexual stimulus and modulate the 'judgment' of concomitant risks and wishes before engaging, or
