ACKNOWLEDGEMENT

*First and foremost, I thank **Allah** for endowing me with health, patience, and knowledge to complete this work.*

*I dedicate my work to the soul of my **Dad** (RIP) and to my **Mom** and my **children (Yassin & Hunia)**.*

*I would like to gratefully and sincerely thank **Prof. DR. Aisha Abo Al Fotouh** for her kindness and endless support.*

*I would like to give special thanks to **Prof. Dr. Mostafa El-Hossini**, for the patient guidance, encouragement and advice he has provided throughout my thesis.*

*I would like to extend my sincere gratitude to **Prof. Dr. Sameh Mohamed Saif**, for providing me valuable suggestion to complete this research.*

*I would like to thank the **National Hepatology and Tropical Medicine Research Institute** for their approval for conducting my research.*

*Finally, I am very grateful to all my **respondents** (patients) who agreed to be interviewed allowing me to get valuable information.*

Abstract

Background: Chronic hepatitis C virus infection is a major cause of chronic liver disease and death throughout the world. In addition to viral factors, several host factors also are implicated in modulating the effectiveness of IFN-therapy for the treatment of HCV infection. Likely, these host factors play an equally important role in modulating the efficacy of IFN- treatment. Therefore, an understanding of how these factors influence IFN- therapy may provide therapeutic targets to improve the efficacy of IFN-treatment several studies have shown an impaired health-related quality of life in patients with CHC compared to general population whereas treatment for this disease often induces similar symptoms as well.

Aim: to estimate the response rate to combined anti-viral therapy and to determine the role of host factors in affecting response to combined anti-viral therapy such as host factors , viral factors, hepatic histopathology, also to measure the changes in the HRQoL of the patients after the treatment.

Methodology: 427 chronic HCV newly recruited patients to receive pegylated interferon and ribavirin for 48 weeks in the National Hepatology & Tropical medicine Research

Institute where all patients completed the SF-36 quality of life questionnaire before treatment and at the end of treatment then followed up for another six months to determine sustained virological response.

Results A total of 427 chronic HCV Egyptian patients with response rate 63.5%. Age is significantly true predictor for SVR (OR=0.975, 95% CI: 0.953- 0.998) while presence of diabetes was negative predictors for response (OR=3.239, 95% CI: 1.493- 7.027). Patients' HRQoL showed deterioration in all domains at the end of treatment compared to baseline measures with high statistical significance ($p < 0.001$). Non-responders showed more deterioration than patients with SVR especially in the perception of "mental health, social wellbeing, bodily pain, and general health".

Conclusion Sustained virological response rate between chronic hepatitis C patients receiving combined anti-viral therapy (interferon and ribavirin) was 63.5%. Age is significantly true predictor for SVR while diabetes was negative predictors for response. HRQoL of patients receiving combined anti-viral therapy (interferon and ribavirin) deteriorated during the course of treatment till the end of treatment.

Key words: *chronic hepatitis C, genotype 4, pegylated interferon, treatment response predictors, sustained virological response, Health-related quality of life*

2012

Chronic hepatitis C virus infection is a major cause of chronic liver disease and death throughout the world.¹

More than 170 million people worldwide are chronically infected by the hepatitis C virus (HCV).² According to the WHO Report of 2002.³ In 2001, chronic liver diseases were responsible for 1·4 million deaths, including 796 000 due to cirrhosis and 616 000 due to primary liver cancer. At least 20% of these deaths are probably attributable to HCV infection—more than 280 000 deaths.⁴

Egypt has a very high prevalence of HCV and a high morbidity and mortality from chronic liver disease, cirrhosis, and hepatocellular carcinoma.⁵

It is not a single disease, but rather a complex clinico-pathological syndrome with multiple causes, varying stages of necro-inflammatory and sclerosing liver damage, different prognoses and responses to treatment⁶.

Egypt has higher rates of HCV than neighboring countries as well as other countries in the world with comparable socioeconomic conditions and hygienic
