

Role of Magnetic Resonance defecography in assessment of pelvic floor dysfunction

Thesis

Submitted for partial fulfillment of Medical Degree in

Radio-diagnosis

Presented by

Marwa Sayed Mohammed Moussa

MBBch, MSc,

Supervised By

Prof. Dr. Abeer Abdel maksoud Montaser

Professor of Radio diagnosis

Faculty of Medicine - Ain Shams University

Dr. Samer Malak Botros

Professor of Radio-diagnosis

Faculty of medicine-Ain Shams University

Dr. Yasser Ibrahim Abdel khaleq

Assistant professor of Radio diagnosis

Faculty of Medicine - Ain Shams University

Faculty of Medicine

Ain Shams University

2019

Acknowledgement

First of all, all gratitude is due to **Allah** almighty for blessing this work, until it has reached its end, as a part of his generous help, throughout my life.

Really I can hardly find the words to express my gratitude to **Prof. Dr. Abeer Abdel maksoud Montaser**, Professor of Radio Diagnosis, Faculty of Medicine - Ain Shams University, for her supervision, continuous help, encouragement throughout this work and tremendous effort she has done in the meticulous revision of the whole work. It is a great honor to work under her guidance and supervision.

I would like also to express my sincere appreciation and gratitude to **Prof. Dr. Samer Malak Botros**, professor of Radio-diagnosis, Faculty of medicine-Ain Shams University, for his continuous directions and support throughout the whole work,

I cannot forget the great help of **Assistant Prof.Dr. Yasser Ibrahim Abdel khaleq**, Assistant professor of Radio diagnosis, as well as **Dr. Aliaa Sheha**, lecturer of radiodiagnosis Faculty of Medicine - Ain Shams University niversity for his invaluable efforts , tireless guidance and for his patience and support to get this work into light.

Last but not least, I dedicate this work to **my family**, whom without their sincere emotional support, pushing me forward this work would not have ever been completed.

Marwa Sayed Mohammed Moussa

Arabic Summary.....	--

List of Abbreviations

ARA	Anorectal angle
ASUH.....	Ain Shams University Hospital
ATFP	Arcus tendineus fascia pelvis
ATLA	Arcus tendineus levator ani
b-FFE	Balanced fast field echo
ES.....	External sphincter
ETL	Echo train length
FFE.....	Fast field echo
FIESTA.....	Fast imaging employing steady state acquisition
FISP	Fast imaging with steady state free precession
FLASH.....	Fast low angle shot
FOV	Field of view
FSE.....	Fast spin echo
GRE	Gradient Echo
H line	Hiatus line
HASTE.....	Half-fourier acquisition single shot turbo spin-echo
HMO	H line, M line, organ prolapse
IS.....	Internal sphincter
M Line.....	Muscular pelvic floor descent
MPL	Mid pubic line
MRI.....	Magnetic resonance imaging
NEX	Partial signal averaging
ODS	Obstructed defecation syndrome
PC.....	Pubocervical
PCF	Pubocervical fascia
PCL	Pubococcygeal line

List of Abbreviations (Cont.)

PD	Proton density
POP	Pelvic organ prolapse
RF	Radio-frequency
SAR.....	Specific absorption rate
SE.....	Spin echo
SNR.....	Signal to noise ratio
SPGR	Spoiled gradient echo
SSH-TSE.....	Single-shot turbo spin echo
SSFP.....	Steady state free precession
SUI	Stress Urinary Incontinence
SSFSE	Single Shot Fast Spin Echo
TE.....	Time to echo
TR	Time to repeat
TSE	Turbo spin echo
UB	Urinary bladder
UD.....	Uterine descent
VCUG	Voiding cystourethrography

Introduction

Pelvic floor failure is a major medical and social problem. It is primarily a problem for multiparous and postmenopausal females. Though it may also affect premenopausal women and men in a smaller proportion.

It can be presented with non specific symptoms, such as urinary and or fecal incontinence or chronic constipation, pelvic pain, and organ prolapse (*Buy and Ghossain, 2013*).

Routine clinical examination and various medical staging systems have been used for the assessment of pelvic floor failure. One of the most accepted clinical staging systems is Pelvic Organ Prolapse Quantification (POP-Q), introduced by the International Continence Society (*Lalwani et al., 2013*).

However, they don't involve a direct assessment method of the anatomy, also the occurrence of underestimation of the extent & degree of the dysfunction, misdiagnosis the site of the prolapse (in more than 45% of cases), and is also less useful for surgical planning. There are other functional investigations, like urodynamic studies and dynamic cystoproctography are currently used to evaluate the dynamics of the pelvic floor

MR defecography offers excellent demonstration of the pelvic soft tissues. It is used to evaluate the functionality of the pelvic floor and pelvic organs while defecating, hence it is called dynamic or functional MR imaging. It is important to perform a dynamic study because certain abnormalities are revealed only during defecation; for example, rectal prolapse or intussusception. Also it allows assessment of spastic pelvic floor

syndrome and descending perineum syndrome and visualization of enteroceles without exposing the patient to harmful ionizing radiation (*Colaiacomo et al., 2009*).

The presence of cine T2 -weighted imaging sequences and high quality surface coils has made MR imaging an excellent competitor for the urodynamic studies, clinical examinations as well as cystoproctography. It doesn't include any of the other known functional MR techniques like DWI and contrast study. A standardized MR imaging protocol is presented that allows for complete imaging of pelvis in less than 15 minutes (*Lalwani et al., 2013*).

Moreover, it is of great value in women with symptoms of multicompartiment involvement for whom a complex repair is planned or who have undergone previous repairs, magnetic resonance (MR) imaging can be a useful preoperative planning tool (*Lalwani et al., 2013*).

Aim of Work

The present study is aiming to highlight the role of MR defecography in assessment of pelvic floor failure.
