

Utility of Diffusion Weighted MR in Differentiation between Benign and Malignant Breast Lesions

Thesis

Submitted for Partial Fulfillment of MD Degree
in Radiodiagnosis

Presented by

Amira Samy Mohammed Sadek Salem

M.B.B.Ch., M.Sc. - Ain Shams University

Under Supervision of

Prof. Dr. Amany Emad El-Din Rady

Professor of Radiodiagnosis

Faculty of Medicine- Ain Shams University

Assist. Prof. Hossam Mousa Sakr

Assistant Professor of Radiodiagnosis

Faculty of Medicine- Ain Shams University

**Assist. Prof. Yasser Ibrahim Abdel
Khalie**

Assistant Professor of Radiodiagnosis

Faculty of Medicine- Ain Shams University

**Faculty of Medicine
Ain Shams University**

2019

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قالوا

سبحانك لا علم لنا
إلا ما علمتنا إنك أنت
العليم العظيم

صدق الله العظيم

سورة البقرة الآية: ٣٢

Acknowledgments

*First and foremost, I feel always indebted to **Allah**, the **Most Beneficent** and **Merciful** who gave me the strength to accomplish this work,*

*My deepest gratitude to my supervisor, **Prof. Dr./ Amany Emad El-din Rady** , Professor of Radiodiagnosis , Faculty of Medicine – Ain Shams University, for her valuable guidance and expert supervision, in addition to her great deal of support and encouragement. I really have the honor to complete this work under her supervision.*

*I must express my deepest thanks to my **Assis. Prof. Dr. Hossam Mousa Sakr** , Assistant Professor of Radiodiagnosis , Ain Shams University, for guiding me throughout this work and for granting me much of his time. I greatly appreciate his efforts.*

*I would like to express my sincere gratitude to **Assis. Prof. Dr. Yasser Ibrahim Abdel Khaliq**, Assistant professor of Radiodiagnosis, Faculty of Medicine, Ain Shams University, for his kind supervision, valuable advice, unlimited sincere help, continuous guidance and for his persistent pushing me to do my best.*

Thanks a lot to all my professors and colleagues for their considerable care and support.

*Special thanks to my **Mother**, my **Father** and all my **Family** members for their continuous encouragement, enduring me and standing by me.*

Last but not least, I would also like to thank my colleagues, my patients and everyone helped me in this study.

 **Amira Samy Mohammed**

Arabic Summary	—

List of Abbreviations

Abbr.	Full-term
ADC	: Apparent diffusion coefficient
ALH	: Atypical lobular hyperplasia
BIRADS	: Breast imaging and reporting data system
CC	:Cranio-Caudal
DCE	: Dynamic contrast enhanced
DCIS	: Ductal carcinoma in situ
DWI	: Diffusion-weighted imaging
DW-MRI	: Diffusion weighted magnetic resonance imaging
FOV	: Field of view
IBC	: Inflammatory breast cancer
IDC	: Invasive ductal carcinoma
LCIS	: Lobular carcinoma insitu
LN	: Lobular neoplasia
MLO	:Medio-lateral oblique
MPG	: Motion-probing gradient
MRI	: Magnetic resonance imaging
NOS	: Not otherwise specified

NPV	: Negative predictive value
NST	: No special type
PPV	: Positive predictive value
RF	: Radiofrequency
ROC	: Receiver-operating characteristic
ROI	: Region of interest
SD	: Standard deviation
SNR	: Signal to noise ratio
SPSS	: Statistical package for social science
SSRF	: Spatial-spectral radiofrequency
STIR	: Short inversion time inversion recovery
T	: Tesla
TDLU	: Terminal duct lobular unit
US	: Ultrasound

Introduction

Breast cancer is a common malignancy and cause of cancer death. Despite improvements in the detection of breast cancer with the widespread application of mammography and ultrasonography, differentiation between benign and malignant breast lesions remains a difficult diagnostic problem (*Min et al., 2015*).

Breast cancer is now a significant cause of worldwide morbidity and mortality. Further, the increasing rate of breast cancer continues to be a major area of concern for both clinicians and researchers. Increased awareness in the affected population leads to more frequent physical examinations and diagnostic imaging procedures which results in earlier diagnosis and hence improved prognosis (*El Fiki et al., 2015*).

The majority of the lesions that occur in the breast are benign. It is important to recognize benign lesions and distinguish them from breast cancer. Breast MRI may be used to distinguish between benign and malignant lesions, reducing the number of breast biopsies done to evaluate a suspicious breast mass (*Wax, 2009*).

Conventional MRI of the breast is mainly based on the combined analysis of the morphological data and enhancement kinetics of the lesions. This gives information about tumor

physics, vascularity, and vascular permeability. It provides high sensitivity yet with moderate specificity for breast cancer, with overlap between benign and malignant lesions (*Ibrahim et al., 2015*).

Due to the low specificity of the conventional MRI, an additional feature is needed to characterize suspicious lesions in order to decrease the number of invasive breast procedures (*Peter et al., 2008*).

Diffusion-weighted MRI (DW-MRI) is an advanced MRI technique, which emerged in the mid-1980s and allows the mapping of in-vivo water diffusion processes in a non-invasive manner; it can delineate the microscopic anatomy of a target tissue or organ. It has a higher sensitivity and specificity in detecting suspicious breast disease at a minimum size of 1 cm than regular MRI. It can provide digital biomarker measurements of tissue properties that are highly relevant to the assessment of tumor progression or responses (*Cai et al., 2014*).

Diffusion is the result of thermal fluctuations with a random pattern and this is often referred to as “Brownian motion”. Diffusion-weighted imaging (DWI) is the primary modality that is used to evaluate acute cerebral infarction. DWI has recently been widely used to evaluate other organs such as the ovaries, pancreas, prostate, liver and breast (*Abdulghaffar and Tag-Aldeen, 2013*).

Recent studies have shown a high accuracy rate in the differentiation between malignant and benign breast lesions using DW-MRI and Apparent Diffusion Coefficient (ADC) measurements. The measured ADC values were significantly lower in malignant lesions compared with benign lesions. Malignant breast tumors show a high amount of cellular structure (due to the intensity of the tumor tissue), resulting in low ADC values for the lesions (*Şahin and Aribal, 2013*).
