Abstract

The study aimed at the effect of the intake of barley and cinnamon on the level of diabetes in type 2 patients and blood lipids and divided the number of 64 patients with no complications of diabetes and non-dieting diet or any sports activity, on 4 groups, including a group of women and others dealing with barley and a group dealing with first And the last one deals with barley and cinnamon together.

A nutritional history was done by taking an average of 24-hour retrieval in the first trial, 6 weeks later and 12 weeks later.

Some laboratory tests, such as total blood lipids and blood glucose levels, were measured from the first trial, 6 weeks later and 12 weeks later.

The results showed an improvement in blood sugar level as well as fat respectively on the Barley group and the last Cinnamon group which showed the most results from the descent of sugar and blood lipids.

All of this is illustrated by the results through tables and graphs.

ACKNOWLEDGMENT

*First of all, there are no words can express my gratifying thanks to my GOD **ALLAH** for strengthening and blessing me in all aspects of my life.*

*I wish to express my deepest thanks, sincere gratitude and appreciation to **prof., Dr. Ibrahim Nagib El Ebrashy** Prof., Of Internal Medicine & Diabetes Faculty of Medicine, Cairo University, for giving me opportunity to work under his supervision, for continuous help during every step of this work, indispensable advises, suggestion guidance, valuable comments and supporting me to achieve this work,*

*I would like also to convey my profoundly gratitude and appreciation to **Prof., Dr. Heba Allah Mostafa Kamal El Dein** Prof. Of Internal Medicine & Diabetes Faculty of Medicine, Cairo University, for giving me the opportunity to work under her supervision, for her kindness valuable suggestions, continuous help during every step of this work, valuable comments, adding her great experience and encouraging me to achieve this work,*

*Also, I wish to express my deepest thanks, to **Dr. Walaa Ibrahim Mohamed Aniess** Prof. Of nutrition & food Sciences Home Economics Dept., Faculty of specific education, Ain- Shams University, for his kindness, adding his great experience and great help in every step of this work,*

*Also, My sincerest thanks and gratitude to **Dr. Zeinab Mostafa Mousa**. Prof., Of nutrition & food Sciences Home Economics Dept. , Faculty of specific education, Ain- Shams University for her supervision, guidance and indispensable help throughout the work,*

I wish to express my grateful to my lovely family specially my mother and my sisters for their love, supporting and encouraging me in achieving this work,

Finally, I would like to express my thanks to all those who helped me in any way in order to finish up this work,

1. Introduction

Nutrition plays a pivotal role in life and in medicine all over the world. In particular, acute and chronic diseases such as diabetes mellitus in most organ systems have pronounced effects on food intake and metabolism with increased catabolism, which lead to nutrition-related conditions like obesity that associated with increased morbidity and eventually death. At the other end of the spectrum, diet is a major determinant of future health, promoting the absence or postponement of disorders like diabetes and related complications (**GBD, 2015**).

Type 2 diabetes mellitus (DM) is an endocrinological chronic metabolic disorder in which prevalence has been rising steadily worldwide (**Deepthi et al., 2017**). Diabetes mellitus resulting from an irregularity in insulin secretions and insulin actions or both. Absence or reduced insulin in turn leads to persistent abnormally high blood sugar and glucose intolerance (**Jahan et al., 2015**). It is estimated that, in the year 2017, 451 million (age 18–99 years) people had diabetes worldwide, and this is potentially it will affect more than 693 million by 2045. Also, it was estimated that almost half of all people (49.7%) living with diabetes are undiagnosed. Moreover, there was an estimated 374 million people with impaired glucose tolerance (**Cho et al. 2018**). Diabetes is not a single disorder, it is a multisystemic disease that is primarily associated with the pancreas, but also affects the skeletal muscles, gastrointestinal tract, kidneys, and brain (**Cornell 2015**).

Type 2 diabetes mellitus is the most widely recognized endocrine issue in humans. Currently it is estimated more than 387 million people had type 2 diabetes worldwide, and this expected to increase to 592 million by 2035 (**Gutiérrez-Rodelo et al., 2017**). Recently, type 2 diabetes is rising rapidly in developing and developed countries; however, it is demonstrated to be ever-rising in the Arab world nations (**Meo et al., 2017**). The global prevalence of type 2 diabetes mellitus is more progressively and recorded as a threatening and most exigent attitude to the healthcare providers. In addition Type 2 diabetes accounts for at least 90% of all cases of diabetes (**IDF, 2015**). Thus, it must take in consider that even with the great developments in medical sciences and diabetes science, it is still an incurable life-long disease, which is swiftly growing among different age groups of men and women. It engages various physiological functions, organs and multiple systems resulting in extensive ranging and highly damaging complications (**James et al., 2002**), which associated with relatively specific long term microvascular complications affecting the eyes, kidneys and nerves, as well as an increased risk for cardiovascular disease (**Punthakee et al., 2018**).

Otherwise, managing and treating diabetes have become more costly due to high financial burden on the patients and the total healthcare system. Moreover, available treatment options in modern medicine have several adverse effects. Therefore, there is a need to develop safe and effective treatment modalities for diabetes. Many herbs and spices which we use them for the daily needs are claimed to have properties of lowering the blood sugar levels, because of these properties they are
