بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قَالَ

لَسْبَّانِكَ لَا مَعْلَمَ لَنَا
إِلَّا مَا مَعْلَمْتَنَا إِنَّكَ أَنْتَ
الْعَلِيمُ الْعَظِيمُ

صدق الله العظيم

سورة البقرة الآية: ٣٢

Acknowledgement

First and foremost, Thanks to **ALLAH**, to whom I relate any success in achieving any work in my life.

I would like to express my deep gratitude and sincere appreciation to **Prof. Mohamed Ali Farrag**, Professor of Chest Diseases, Faculty of Medicine, Ain Shams University for his sustained support, continued encouragement and for his precious time and effort that made this thesis possible. It was great honor to me to do this thesis under her supervision.

I owe special feeling of gratitude to **Prof. Gehan Mohamed El Assal**, Professor of Chest Diseases, Faculty of Medicine, Ain Shams University for her great help, close supervision, wise opinions, guidance and her continuous encouragement and for her precious effort. Without her support, this work would not have been completed.

My deep appreciation to **Prof. Ashraf Mokhtar Madkour**, Professor of Chest Diseases, Faculty of Medicine, Ain Shams University for his valuable instructions, unlimited help and great deal of support, his endless patience with me and for his experienced guidance and helpful suggestions that make the completion of this work possible.

My deep appreciation to **Ass.Prof. Nehad Mohammed Osman**, Assistant Professor of Chest Diseases Faculty of Medicine Ain Shams University for her valuable instructions, unlimited help and great deal of support, her endless patience with me and for her experienced guidance and helpful suggestions that make the completion of this work possible.

A special word of thanks goes to my supportive family without their help this work wouldn't come to light.

Thanks are extended to my colleagues in Chest Department, Faculty of Medicine, Ain Shams University, whom I greatly appreciate their support. Last but not least I would like to express my feelings to all the patients, to whom I dedicate all my efforts.

Manar Hussieny Taha

Implementation of bronchoscopic conventional transbronchial needle aspiration service in a tertiary care chest hospital

Abstract

Background: Conventional transbronchial needle aspiration (C-TBNA) is a unique technique that allows the sampling tissue from beyond the endobronchial tree, such as enlarged lymph nodes, peribronchial, or submucosal lesions. However, it remains underutilized and even unavailable in many countries and centers around the world including Egypt.

Objective: This study aimed to implement bronchoscopic CTBNA service in a tertiary care chest hospital with special emphasis on the diagnostic yield, complications encountered, and learning experience.

Patients and methods: This cohort study was conducted on 60 patients with bronchoscopic nonvisible extraluminal lesions who have sought bronchoscopic C-TBNA service at the Bronchoscopy Unit of both Ain Shams University Hospital and Giza Chest Hospital during the period from June 2016 to February 2018.

Results: The overall C-TBNA had a diagnostic yield of 88.3% in which 68.3% were malignant and 20% had sarcoidosis without serious complications recorded except for minor nonlife-threatening bleeding in 21.7% of cases. After 6 months of C-TBNA learning experience, the diagnostic yield showed improvement in physicians without previous C-TBNA experience, but without reaching a statistical significance. Also, there were significant reduction in both duration and complications of C-TBNA.

Conclusion: Implementing C-TBNA service in a tertiary care chest hospital in bronchoscopically nonvisible extraluminal lesions seems to be a safe, easy technique with high diagnostic yield and its learning performance was able to be improved over time.

Keywords: conventional transbronchial needle aspiration, fiberoptic bronchoscope, physicians without transbronchial needle aspiration experience bronchoscopic nonvisible lesions.

Introduction

Pulmonologists usually try to determine the nature of lymph node enlargement and submucosal or peribronchial diseases in order to differentiate benign from malignant process and add essential staging information to determine the best treatment plan for non small cell lung cancer patients (**Jacob et al., 2014**).

Transbronchial needle aspiration (TBNA) is a simple, safe technique that can be done without additional resources in any centers with a bronchoscopy service. It provides rapid diagnostic information in malignant and benign conditions and staging information in non small cell lung cancer (NSCLC) and may avoid the delays, risks, inpatient stay and financial implications associated with surgical exploration of the mediastinum (**Le Jeune & Baldwin, 2007**).

TBNA was applied by Wang and Terry in the 1980s it is a method of sampling performed under conscious sedation via a flexible bronchoscope with a few risk of complications, major complications represent 0.3% in a meta-analysis and mainly were haemorrhage, pneumothorax requiring chest drainage and pneumomediastinum (**Holty et al., 2005**).

Non invasive techniques such as computed tomography (CT) scanning and positron emission tomography (PET), scanning provide essential radiological information based on size, characteristics and metabolic activity of lesions but not favourable due to suboptimal sensitivity and specificity of both techniques and need for definitive diagnosis before deciding surgical treatment in malignant diseases (**Andrea et al., 2014**).

Percutaneous radiologically guided needle aspiration has been used as a staging investigations but has a significant risk of bleeding from central vessel puncture and risk of pneumothorax in 25-30% of these cases (**Sachin et al., 2013**).

The gold standard for diagnosis and staging is via mediastinoscopy, anterior mediastinotomy or thoracotomy depending on node station, they has sensitivity of 87% and specificity of 100%, but requires general anaesthesia and risk of death in 0.2% and morbidity in 1% (**Neal et al., 2009**).

Ultrasound guided mediastinal lymph node aspiration either via endobronchial (EBUS) or endoscopic (EUS) techniques has been done, they need experienced
