Date: 12 June 2019

STATEMENT

This thesis is submitted as a partial fulfilment of Master of Science in Civil Engineering, Faculty of Engineering, Ain shams University.

The author carried out the work included in this thesis, and no part of it has been submitted for a degree or a qualification at any other scientific entity.

Mohamed Ahmed Abdul Rahim Mohamed Turk

Date: 12 June 2019

RESEARCHER DATA

Name :
Mohamed Ahmed Abdul Rahim Mohamed Turk

Date of birth : 22/4/1990

Place of birth : Egypt

Last academic degree : B.Sc. in Civil Engineering

Field of specialization : Structural Engineering

University issued the degree : Helwan University

Date of issued degree : 2012

Current job : Structural design engineer

To My Parents....

ACKNOWLEDGEMENT

First, I should state the greatest thanks to our **God** that it is only by his willing I have succeeded to finalize this work.

I would like to thank deeply my supervisor **Dr. Gamal Hussein Mahmoud**, for his great patience, continued guidance, encouragement, helpful advice and excellent supervision during the research and patience in reviewing the drafts and results during the preparation of this thesis.

I am deeply grateful to **Dr. Hisham Ahmed El-Arabaty**, for his encouragement, helpful advice, excellent supervision and patience in reviewing the drafts and results during the preparation of this thesis. Great thanks also to his fruitful support in the review and correspondences of the publications of this work.

I would like to thank my supervisor **Dr. Nasr Eid Nasr**, for his great patience, continued guidance, encouragement, helpful advice and excellent supervision during the research and patience in reviewing the drafts and results during the preparation of this thesis.

Last but not least, I **dedicate** this thesis to my “**Mother's soul**”, my supportive and loving “**Father**”, my very special, cheerful and loving “**Wife**”, and I am grateful to all of my “**Family**” for their patience, support and encouragement during the research period.

Thank you all....

ABSTRACT

Thermal analysis of RC structures under the effect of uniform temperature change poses a special kind of problem, where the high axial stiffness of horizontal beam elements used in finite element analysis produces correspondingly high lateral forces, and straining actions in the supporting columns, especially the ground floor columns. This effect is most pronounced for the external columns.

In this study, a novel proposal is made for developing an analytical approach for assessment of the effect of bending cracks along the beam length on its axial stiffness. The proposed approach is utilized for the development of a software package for the computation of the effective axial stiffness of beams, taking into consideration the resulting cracked-section strains at the top and bottom fibers of the beam sections along its length. Effect of applying varying axial force levels to the beam is studied in detail, and curves are developed showing the variation of the beam's axial stiffness with the applied axial loads. Effect of different parameters including steel reinforcement level, and span length are also taken into account.

The developed relationship curves are utilized using a newly developed analytical algorithm for the iterative analysis of RC multi-storey frames under the effect of thermal expansion/contraction. A new Excel/Visual Basic software package is developed, and used to control and perform iterative analysis runs on ETABS program, while continually modifying the axial stiffness modification factors of the beams, to reach the accurate value of the modification factors at convergence.

A group of building frames designed according to the Egyptian code of Practice are used for application of the newly developed algorithm and software package, and the effect of

different numbers of floors on the axial forces developed in thermal analysis is investigated, with emphasis on estimation of the applicable modification factors in each case. The practical values obtained for these modification factors are compared to the common code specifications, and the common practice in design offices in the Egyptian market. Several geometric and section properties of the beam elements in the studied buildings are varied to widen the range of the study. The analysis results are used to develop useful recommendations for design engineers in this field.

Keywords: Thermal Analysis, Temperature Changes, Finite Element Modeling, Concrete Cracking, Axial stiffness, Reinforced Concrete, Tensile Stress.
