

Histological Study of an Experimentally Constructed Decellularized Rat Lung as a Model of Whole Organ Three-Dimensional Natural Scaffold

Thesis

*Submitted for Partial Fulfillment of Master Degree in
Histology and Cell Biology*

By

Marium Romany Abdelsayed

*Demonstrator of Histology and Cell Biology
Faculty of Medicine, Ain Shams University*

Under Supervision of

Prof. Dr. Suzi Sobhy Atalla

*Professor of Histology and Cell Biology
Head of Histology and Cell Biology Department
Faculty of Medicine, Ain Shams University*

Prof. Dr. Gehan Khalaf Megahed

*Professor of Histology and Cell Biology
Faculty of Medicine, Ain Shams University*

Dr. Asmaa Abd El-Monem Abo Zeid

*Lecturer of Histology and Cell Biology
Faculty of Medicine, Ain Shams University*

*Histology and Cell Biology Department
Faculty of Medicine
Ain Shams University*

2019

Acknowledgment

*First and foremost, I would like to thank **GOD**, for helping me achieve every success in my life.*

*I would like to express my deepest thanks and gratitude to **Prof. Suzi Sobhy Atalla**, Professor of Histology and Cell Biology, Faculty of Medicine, Ain Shams University, for her precious time and generous advice. It was a great honor to work under her guidance.*

*My deepest thanks to **Prof. Gehan Khalaf Megahed**, Professor of Histology and Cell Biology, Faculty of Medicine, Ain Shams University, for her precious time, and valuable instructions. Her careful supervision and skillful comments were so helpful to me.*

*I also wish to express my deepest gratitude to **Dr. Asmaa Abo Zeid**, Lecturer of Histology, Faculty of Medicine, Ain Shams University, for her skillful and generous scientific guidance throughout our journey. Her close supervision and encouragement were the cornerstone to complete this work.*

*Finally, I would like to thank **my husband**, my biggest support; for always believing in me and pushing me forward. I also wish to thank my lovely **Son Pavly**; as a mother, the look in his eyes is always a great motivation to me.*

*Words fail to express my gratefulness to my dear **father, mother, brothers & sisters** who were always there for me.*

Marium Romany

TEM	Transmission Electron Microscope

Abstract

Introduction: With the increase of end stage lung diseases and the great problems facing lung transplantation tissue engineering become a promising solution. The first step in lung engineering is to obtain a 3D Extracellular matrix lung scaffold via decellularization. Decellularization aims to remove cells from tissue ultrastructure while preserving the mechanical and biological properties of the tissue. Intact ECM provides critical cues for differentiation and migration of cells that are seeded onto the organ scaffold.

Objectives: This study aimed to obtain an intact and well-preserved ECM lung scaffold by decellularization of rat lungs.

Methods: Decellularization of lungs of seven Wistar rats was achieved by perfusing detergents through the pulmonary artery. The resultant scaffolds were fixed and analyzed histologically.

Results: It was found that the decellularization process effectively removed the cellular and nuclear material while retaining native the 3D ECM of lung tissue. The architecture of the collagen and elastic fibers networks were preserved as comparable to the native lungs. Furthermore, the basement membranes of the bronchiolar and interalveolar septa were intact.

Conclusions: This methodology is expected to allow decellularization of human lung tissues and permits future scientific exploration in tissue engineering.

Keywords: extracellular matrix , lung, decellularization, rat.

INTRODUCTION

Recently, end stage pediatric and adult lung diseases are increased dramatically. This represent one of the great problems facing healthcare systems worldwide as human lungs do not generally repair or regenerate. These diseases include chronic lung diseases of prematurity (bronchopulmonary and alveolar capillary dysplasia), chronic obstructive pulmonary disease which includes emphysema and chronic obstructive bronchitis, idiopathic pulmonary fibrosis, cystic fibrosis and idiopathic pulmonary arterial hypertension (**Minino et al., 2011; Robert and Gabriel, 2011**).

The only current viable option for patients with end stage diseases is lung transplantation as pharmacological intervention helps only to decrease the symptoms at the various disease stages (**Mark et al., 2014**).

But unfortunately, lung transplantation still has many problems, for example to choose a suitable candidate you must exclude those with recent malignancy, active infection with virus B or C with proved liver damage, proved extrapulmonary vital organ dysfunction and some HIV positive recipient (**Robert and Gabriel., 2011**).

Another problem facing lung transplantation is waiting for a suitable donor. The most common and available donor is brain-dead organ donor, but for sorrow usually there is insults

that can happen to the lung during the hospital admission of the donor. Such as volume overload, acute lung injury, contusion, aspiration and pneumonia. So, the gap between the number of patients who have received a transplant and those who are in the waiting list has become wider than ever (**Orens and Garrity, 2009**).

Also, there are many complications after lung transplantation. This include primary graft dysfunction (acute graft rejection with noncardiogenic pulmonary edema in the first 72 hours post transplantation), air way ischemia, infections that may be viral or bacterial and considered a leading cause of early and late deaths, acute rejection and chronic graft dysfunction (**King-Biggs et al., 2003**).

Over the years, the researchers kept thinking in alternative sources of organs, they have investigated xenotransplantation and tissue engineering.

"Xenotransplantation is the transplantation of living cells, tissues or organs from one species to another; thus far, organ transplant from animals to humans has been impossible because of the overwhelming rejection and the risk of transmitting animal viral diseases to humans" (**Baptista et al., 2009**).

Tissue engineering is a relatively new field that uses living cells, biocompatible materials, and suitable biochemical
