**ELECTROCHEMICAL BEHAVIOR OF PASSIVE FILMS  
ON MOLYBDENUM-CONTAINING STAINLESS  
STEELS IN AQUEOUS SOLUTIONS**

A Thesis

*Presented to*

**Cairo University**

*By*

*Amany M. Fekry*

*(A.M. Fekry)*

B. Sc.

Faculty of Science, Cairo University, 1999

In partial fulfillment of the requirements

*For*

***The Degree of Master of Science(M. Sc.)***

Prof. Dr. **Y.M. Issa**  
Vice Dean For Post Graduate Studies  
Faculty Of Science  
Cairo University

# Approval Sheet

Title of the M. Sc. Thesis

**Electrochemical Behavior of Passive Films on Molybdenum-Containing  
Stainless Steels in Aqueous Solutions**

Name of the candidate: Amany M. Fekry

This thesis has been approved for submission by the supervisors:

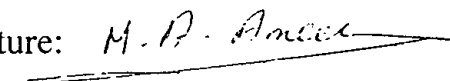

1- Prof. Dr. Fakiha El-Taib Heakal

Signature:

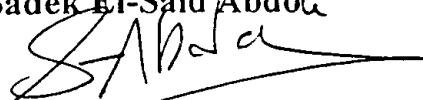

2- Assistant Prof. Dr. Magda A. Ameer

Signature:

Prof. Dr. Sadek El-Said Abdou

Chairman of the Chemistry Department.

Faculty of Science-Cairo University.

## Abstract

**Name:** Amany M. Fekry

**Title of the thesis:** Electrochemical Behavior of Passive Films on  
Molybdenum-Containing Stainless Steels in Aqueous  
Solutions.

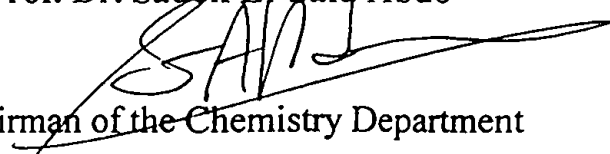

**Degree:** M. Sc. Unpublished Master of Science Thesis  
Faculty of Science-Cairo University, 2003.

This work has been carried out to study the behavior of passive films on molybdenum-containing austenitic stainless steels in aqueous universal buffer solutions with various pH values including acidic, neutral and basic ranges. Studies included also the effect of anion type and concentration of some corroding solutions, viz  $\text{Na}_2\text{SO}_4$  and  $\text{NaCl}$  electrolytes, as well as the effect of  $\text{N}_2$  gas. The techniques used are open-circuit, potentiodynamic (Tafel plots) and ac-electrochemical impedance spectroscopy (EIS).

**Key Words:** ac-impedance, Corrosion, Molybdenum, pH, Polarization,  
Stainless steel alloys, Tafel plots.

**Supervisors:** Prof. Dr. F. El-Taib Heakal, Assistant Prof. Dr. M. A. Ameer.

**Prof. Dr. Sadek El-Said Abdo**

Chairman of the Chemistry Department  
Faculty of Science-Cairo University

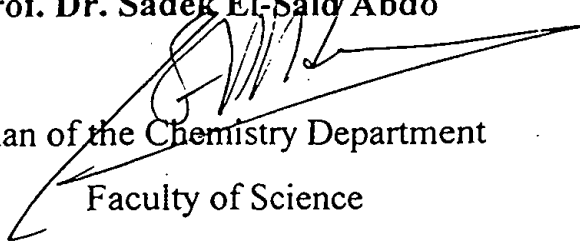

## Statement

Beside the work carried out in this thesis, the candidate has attended and successfully passed a final examination of M. Sc. courses during the academic year 1999-2000 in non-organic chemistry covering the following topics:

- 1) Group symmetry
- 2) Quantum Chemistry
- 3) Adsorption
- 4) X-ray Analysis
- 5) Electrochemistry
- 6) Electrokinetic Phenomena
- 7) Molecular Structure Determination
- 8) Advanced Inorganic Chemistry
- 9) Non-Ionizing Solvents
- 10) Nuclear Chemistry
- 11) Metallurgy
- 12) Solar Energy
- 13) Chelatimetry
- 14) Molten Salts
- 15) Mathematical Modeling
- 16) Catalysis
- 17) Inorganic Reaction Mechanisms
- 18) Advanced Analytical Chemistry
- 19) Electrode kinetics
- 20) Statistical Thermodynamics
- 21) Physical Polymer
- 22) Solar Energy
- 23) Thermal Analysis
- 24) Mathematics
- 25) German Language

Prof. Dr. Sadek El-Said Abdo

Chairman of the Chemistry Department  
Faculty of Science

## ACKNOWLEDGEMENT

*I am very grateful to Prof. Dr. F. El-Taib Heakal, professor of physical chemistry, Faculty of science, Cairo University for suggesting the research problem and her deep insights and illuminating comments that made this work possible. Her supervision for this thesis is a real proud for me.*

*Thanks to Dr. M. A. Ameer, Assistant professor of physical chemistry, Faculty of science, Cairo University for her sustained encouragement, valuable suggestions, great help and genuine interest in my work.*

*Thanks are also due to Dr. A. Abdel Aziz for his constant support and encouragement at the beginning of this work.*

*Also I appreciate very much the moral support I got from my dear sister Hala M. Fekry.*

*Finally, I am deeply grateful to my loving parents to whom I am very much indebted and will be forever.*

## INTRODUCTION

### AND LITERATURE REVIEW

English metallurgist Harry Brearly, working on a project to improve rifle barrels, accidentally discovered, in 1913, that adding chromium to low carbon steel gives it stain resistance. In addition to iron, carbon, and chromium, modern stainless steels may also contain other elements, such as nickel, niobium, molybdenum, and titanium. Nickel, molybdenum, niobium and chromium enhance the corrosion resistance of stainless steel. It is the addition of a minimum of 12 % chromium to the steel that makes it resists rust, or stain 'less' than other types of steel. The chromium in the steel combines with oxygen in the atmosphere to form a thin, invisible layer of chrome-containing oxide, called the passive film.

#### **1- Types of stainless steels:**

Stainless steels are generally subdivided according to their metallographic structures into three main categories, a) *Austenitic stainless steels* forming a family of stainless steels made up of two groups of materials [1] which are chromium-manganese-nickel types, or 200 series, and the chromium-nickel types, or 300 series. Austenitic steels have austenite as their primary phase (face centered cubic crystal). These are not hardenable by heat treatment (i.e. changing the structure and shape of steel by applying stress at low temperature). The most familiar stainless steel is probably Type 304, sometimes called T 304 or simply 304. Type 304 surgical stainless steel is an austenitic steel containing 18-20 % chromium and 8-10 % nickel, and Type 316 (similar to 304 with Mo added to increase opposition to various forms of deterioration), they offer the most resistance to corrosion in numerous standard services. Applications include cooking utensils, food processing

equipment, exterior architecture, equipment for the chemical industry, truck tailors, and kitchen sinks. b) *Ferritic stainless steels* which have ferrite (body centered cubic crystal) as their main phase. These steels contain iron and chromium, based on the type 430 composition of 17 % chromium. Ferritic steel is less ductile (i.e. ability to change shape without fracture) and is not hardenable by heat treatment. c) *Martensitic stainless steels* (orthorhombic martensite microstructure) are low carbon steels built around the type 410 composition of iron, 12 % chromium, and 0.12 % carbon. They may be tempered and hardened. Martensite gives steel great hardness, but it also reduces its toughness and makes it brittle, so few steels are fully hardened.

There are also other grades of stainless steels, such as precipitation-hardened, duplex, and cast stainless steels. Stainless steel can be produced in a variety of finishes and textures and can be tinted over a broad spectrum of colors. From the corrosion point of view, the austenitic alloys, especially those belonging to the 300 series exhibit resistance properties superior to those of the ferritic or martensitic steels.

## **2- Types of corrosion in stainless steels:**

Johnson [2] reported that in the bioprocessing industry, stainless steels, because of the environment, would be subject to pitting corrosion, crevice corrosion and possibly stress corrosion cracking. It was shown that the resistance increased with an increase in the chromium, molybdenum, nitrogen and nickel content of the stainless steels.

Karlberg and Wranglen [3] studied the mechanism of crevice corrosion of stainless Cr steels in neutral 3 % NaCl solution. It was found that immediately after the start of an experiment, both pH and potential of steel
