Name of Candidate: Mona Mohammed Nabil Hussein Kortam

Degree: Ph.D.

Title of Thesis: Biological control of certain greenhouse pests

Supervisors: Dr. Sayed Ashraf Gamal El Din El Arnaouty.

Dr. Amal Ibrahim Afifi.

Dr. Ibrahim Hassan Heikal.

Department: Economic Entomology and Pesticides

Branch: Economic Entomology

Approval: / / 2019

ABSTRACT

This study was conducted to outcome with practical successful strategies using biological control programs for major greenhouse pests, especially on sweet pepper and tomato crops, by developing and reducing the cost of natural enemies rearing in order to cut down on biological control cost. Improving mass rearing of the alternative host *E. kuehniella* through added nutrients to larval rearing and reducing costs by using *E. kuehniella* wastes to produce animal feed. Three alternative hosts *E. kuehniella*, *S. cerealella* and *C. cephalonica* were tested for rearing of *Trichogramma* Parasitoids. *E. kuehniella* is the best for rearing. The effect of cold storage on *T. euproctidis* was studied by storage on host eggs *E. kuehniella* and on *T. euproctidis* pupa. The results show that the parasitized eggs of *T. euproctidis* could be stored at 8°C. Four types of frozen eggs (*E. kuehniella*, *S. cerealella*, *C. cephalonica* and *S. littoralis*) were tested as a factitious host for mass rearing of *Orius albidipennis* and *O. laevigatus*. Obtained results revealed that the lowest overall mortality rates to adulthood were recorded for nymphs that fed on *E. kuehniella* eggs. Also five types of plants (Bean pods, Lettuce vein, *Geranium* leaves, Onion leaves and Potato vein) were tested as an egg laying substrate for *O. albidipennis* and *O. laevigatus*. Bean pods recorded the highest number of laid eggs (145.83 and 149.89) for *O. albidipennis* and *O. laevigatus*, respectively. Four media were evaluated as a substrate to avoid cannibalism in larval rearing of *Ch. carnea*. Using *E. kuehniella* cadavers resulted the highest number of produced adults (1646 adults). Three ovipositional substrate types and 3 colors were tested for adult rearing. Three categories of pesticides (insecticides, acaricides and fungicides) were tested on *M. caliginosus* and *O. albidipennis*. Monitoring pest during the plantation season in a commercial greenhouse located at Berkash. Three insect pests recorded in tomato plantations: *T. absoluta*, the whitefly (*B. tabaci*), and aphids (*A. gossypii*, and *M. persicae*). The red spider mite *T. urticae*, *T. tabaci* and *B. tabaci* were the most dominant pests on sweet pepper plantations. Three control strategies were carried out using: *A. swirskii* at a rate of 2/m², *M. caliginosus* (at a rate of 1/m²) and *O. albidipennis* at a rate of 1/2 adults/m², while the fourth untreated (control). The obtained results showed that *T. urticae* was controlled successfully using *A. swirskii* (2mites/leaf) and *O. albidipennis* (2.8mites/leaf). Comparison between biological and chemical control of certain sweet pepper pests in greenhouses were conducted. The results show that *O. albidipennis*, *M. caliginosus*, *Ch. carnea* and *T. euproctidis* proved to be efficient in controlling sweet pepper pests in greenhouses. Also comparison between biological and chemical control of certain tomato pests in greenhouses was carried out. The first one, for the biological control using: *M. caliginosus* at a rate of 1/2 nymph/m², *Ch. carnea* at a rate of 1/4 larvae/m² and *T. euproctidis* at a rate of 25 parasitoid/m²; the second one was treated with the usual chemical control on the farm while the third remained untreated (control). The best results were obtained when applied biocontrol agents. The effect of different microclimatic parameters on the dispersal of the two *Trichogramma* species which were used to control *T. absoluta* on tomato in greenhouses.

Keywords: Improvement of mass rearing; *T. euproctidis*; *Ch. carnea*; *M. caliginosus*; *O. albidipennis*; Biological control; greenhouse pests; aphids; Thrips; whitefly; The red spider mite; *T. absoluta*; Sweet pepper; Tomato.

DEDICATION

With deepest love, I would like to dedicate this work to my late father who gave me encouragement, cooperation and a river of continuous help. Thanks for what you gave me.

I also dedicate this work to my mother for her patience, guidance, support and caring attitude, as well as to my brothers and my grand family for all the hearty support they offered me during this period of my post graduate studies.

ACKNOWLEDGEMENT

*Firstly, ultimate thanks and praise be to **Allah**, the most gracious who shined my way and supported me with patience and perseverance to fulfill this work.*

*I wish to express my deepest appreciation and sincere gratitude to **Dr. Sayed Ashraf El Arnaouty**, Professor of Biological Control, Department of Economic Entomology and Pesticides, Faculty of Agriculture, Cairo University for his supervision, constructive criticism, continuous efforts, guidance, concern, devoted efforts, kindness throughout all stages of this study and kind assistance in the review of this manuscript. No words can express my sincere and deep sense of reverence for him. Thank you for contribution in building my life.*

*Sincere thanks are due to **Dr. Amal Ibrahim Afifi**, Professor of Biological Control,, Department of Economic Entomology and Pesticides, Faculty of Agriculture, Cairo University for her valuable guidance in supervising this study.*

*I wish to express my appreciation to **Dr. Ibrahim Hassan Hekial**, Professor of Biological Control, Central laboratory of Organic Agriculture, Agriculture Research Center for reviewing this manuscript.*

*Special deep appreciation, sincere thanks, and deep grateful to **Dr. Valérie Beyssat-Arnaouty** for continuous help to complete this work and for her revision of this manuscript.*

*My thanks also go to **Dr. Atef Abd El Aziz**, Director of the Central Laboratory of Organic Agriculture, Agriculture Research Center, for his encouragements.*

*Sincere thanks are also due to **Dr. Hicham Fatnassi** INRA French National Institute for Agricultural Research*

*Many thanks to **Mrs Pizzol** (INRA Sophia-Antipolis) for her efforts in data analysis and **Eng. Mohamed Kamal**, who offered me the opportunity to implement Biological Control in greenhouses.*

Special thanks for the Chrysopa Mass Production laboratory at Faculty of Agriculture, Cairo University for providing me all materials completing my experiments.

Sincere thanks for all the staff members of the Chrysopa Mass Production laboratory at Faculty of Agriculture, Cairo University.
