Microalgae as primary producers for fry feeding of some marine fishes.

B(٤٧٠٧)

Thesis

Submitted to the Faculty of Science

Alexandria University

For the Degree of Master of Science

(Botany)

By

Heba Saad El Said

B.Sc. (1987)

Supervised by

Prof. Dr. Abd- El Fattah Khaleafa

Professor of phycology
Faculty of Science
Alexandria University

Prof. Dr. Sami H. Shaalan

Professor of phycology
Faculty of Science
Alexandria University

Prof. Dr. Magda I. Zaki

Professor of Fish
reproduction
National Institute of
Oceanography
and Fisheries, Alexandria

1998

To

***all my family with all
my love***

Acknowledgment

I wish to express my deepest gratitude and appreciation to my supervisors for their guidance and encouragement.

Words can not express how grateful I am to Prof. Dr. Abd El Fattah Khaleafa and Prof. Dr. Sami Hamed Shaalan, Professors of phycology, Botany Department, Faculty of Science, Alexandria University for their invaluable supervision, untiring efforts, unfailing help, expertise and unending cooperation and kindness.

My great thanks to Prof. Dr. Magda I. Zaki, Professor of fish reproduction, National Institute of Oceanography and Fisheries, for her moral support, for facilities she kindly put under my disposal and for her endless encouragement and love.

I am greatly indebted to Prof. Dr. Meseda M. El Gharabawy, Prof. of induced spawning, National Institute of Oceanography and Fisheries, for her great help during protein profile estimation.

Special and deep thanks to Dr. Soad Mohy El-Din, Lecturer of phycology for her great help, supervision throughout the practical work, programming and guidance during the progress of this work.

Special thanks must go to all my colleagues in phycology lab, Faculty of Science and Fish reproduction lab. Especially Dr. Samira S. Assem lecturer of fish Biology (M107).

Finally, I wish to extend all my sincere thanks to my lovely mother, my dear father, my husband, Mahmoud Mohamed Esawy, my brothers, sisters and especially to my sweet son Mohamed for their continuous kind help, unreversed encouragement and patience

INTRODUCTION

AND AIM OF THE WORK

Introduction

Marine microalgae are mainly the floating microscopic plant component of the sea water which form the basic food of almost all the larval organisms, either crustaceans, molluscs or fishes. They are primary producers of any aquatic ecosystem and they belong to various classes of algae (Depauw & Parsons , 1989). The important components of microalgae are Diatoms, Dinoflagellates, silicoflagellates (phy-toflagellates), coccolithophores, blue green algae and the "hiddenflora" the Nannoplankters. Among these the diatoms and phytoflagellates are the significant organisms since, they form the primary link in the food chain of the aquatic system.

The success of any hatchery operation depends mainly on the availability of the basic food of microalgae (Gopinathan, 1996). The importance of these microalgae as the essential food of almost all the larval forms, the isolation, maintenance and mass culture of these organisms are a pre-requisite in the hatchery systems throughout the world. They are likely to be of great importance as the chief food of molluscan larvae, particularly in the initial stages. Oyster larvae can ingest nothing larger than 10 microns and appear to rely for food on minute phytoflagellates excluding the diatoms (Gopinathan, 1984).
