Statement

This thesis is submitted as a partial fulfillment of Master of Science in Electrical Engineering, Faculty of Engineering, Ain Shams University. The author carried out this work included in this thesis, and no part of it has been submitted for a degree or a qualification at any other scientific entity.

Ahmed Abdul Aziz Mohamed El-hag

Researcher Data

Name: Ahmed Abdul Aziz Mohamed El-hag

Date of Birth: 18/6/1985

Place of Birth: Kuwait

Last academic degree: Bachelor of engineering

Field of specialization: Electronics and Communication
Engineering

University issued the degree: Modern Academy for Engineering
and Technology

Date of issued degree: May 2009

Abstract

Coordinated multipoint (CoMP) is a multiple-input-multiple-output (MIMO) technique used in the fourth generation (4G) cellular networks in order to enhance edge user services. Coordination among different base stations (network nodes) is done through exchange of information among base stations over the backhaul of the network. In this dissertation, we model CoMP as an adaptive diffusion network, with the base stations as the network nodes. In adaptive diffusion networks, one of the main challenges is the large volume of data exchange among nodes needed to arrive at a collective decision. We first introduce an overview of the adaptation and learning process over a network through non-cooperative, centralized, and distributed manners. A comparison of the steady-state mean square deviation (MSD) performance for all strategies is provided. Two new algorithms for adaptive diffusion networks are proposed which offer a tradeoff between the mean-square error performance of the system and the volume of data exchanged among network nodes while preserving the network convergence rate. A study of the mean-square-stability of the network under the proposed algorithms is provided. Also, a study of the mean-error dynamic behavior of the network is carried out. A closed-form expression for the overall network steady-state mean-square-error is derived and verified against simulated data. The proposed algorithms is finally applied to a cellular network location estimation problem, and delivers good performance even under 75% reduction in data exchange volume.

Thesis Summary

The thesis structure consists of six chapters and organized as follows.

Chapter 1

Chapter 1 provides motivation and insights from the thesis topics. In addition, the contributions of the thesis and thesis organization are provided.

Chapter 2

Chapter 2 discusses adaptation and learning over non-cooperative, centralized, and diffusion modes of operations. In addition, the steady-state mean square deviation (MSD) performance for all modes is provided.

Chapter 3

In Chapter 3, two distributed algorithms based on diffusion strategy are proposed. The proposed algorithms provide a tradeoff between the mean-square-error (MSE) performance and data exchange volume over the network while preserving the convergence of the mean network error. Also, the simulated MSD evolution for the proposed algorithms were conducted.

Chapter 4

Chapter 4 provides a mean-square-error (MSE) analysis of the proposed algorithms. In addition, the convergence analysis of the mean-error of the network is carried out. Also, the steady-state mean-square error (MSE) of the network under the proposed algorithms is derived and verified against simulated data. Finally, the computational complexity of the proposed algorithms are compared to the traditional adapt-then-combine (ATC) diffusion algorithm.

Chapter 5

In chapter 5, the proposed algorithms are applied to a distributed point target estimation problem as a case study, where multiple base stations exchange information and act as coordinated multipoint (CoMP) system.

Chapter 6

In chapter 6, the thesis is concluded and suggested future directions are provided.

Keywords: CoMP, distributed optimization, adaptive networks, diffusion adaptation, synchronous behavior, asynchronous behavior, target localization.

Acknowledgment

Thanks, must go to Allah creator of universe who ordered us to study and explore his creations to know Allah better. However, as I come to understand more, I find that there is so much more knowledge to absorb and to get to grips with. The author takes this opportunity to gratefully his supervisors, Prof. Dr. Salwa El-Ramly, Dr. Mirette Sadek, and Dr. Mona Zakaria for their guidance, constant supervision, and constructive suggestions on the matter of this research.
