**The role of hepcidin as a biomarker for
iron status in patients with chronic
kidney disease (stage IV and V) with
negative virology**

A Thesis

Submitted for partial fulfillment of Master degree
in Internal Medicine

By

Ahmed Mahmoud Ibraheem

M.B,B.CH-(2012)

Under Supervision of

Prof. Dr. Magdy Mohamed El Sharkawy

Professor of Internal Medicine and Nephrology
Faculty of Medicine, Ain Shams University

Prof. Dr. Heba Wahid Elsaid

Professor of Internal Medicine and Nephrology
Faculty of Medicine, Ain Shams University

Dr. Lina Essam Khedr

Lecturer of Internal Medicine and Nephrology
Faculty of Medicine, Ain Shams University

الْعَلِيمُ الْعَظِيمُ

حَدَّثَنَا اللَّهُ الْعَظِيمُ

سورة البقرة الآية: ٣٢

Acknowledgments

*First and foremost, I feel always indebted to **Allah**, the **Most Beneficent** and **Merciful** who gave me the strength to accomplish this work,*

*My deepest gratitude to my supervisor, **Prof. Dr. Magdy Mohamed El Sharkawy**, Professor of Internal Medicine and Nephrology, Faculty of Medicine, Ain Shams University, for his valuable guidance and expert supervision, in addition to his great deal of support and encouragement. I really have the honor to complete this work under his supervision.*

*I would like to express my great and deep appreciation and thanks to **Prof. Dr. Heba Wahid Elsaid**, Professor of Internal Medicine and Nephrology, Faculty of Medicine, Ain Shams University, for her meticulous supervision, and her patience in reviewing and correcting this work,*

*I must express my deepest thanks to **Dr. Lina Essam Khedr**, Lecturer of Internal Medicine and Nephrology, Faculty of Medicine, Ain Shams University, for guiding me throughout this work and for granting me much of her time. I greatly appreciate her efforts.*

*Special thanks to my **Parents** and all my **Family** members for their continuous encouragement, enduring me and standing by me.*

 **Ahmed Mahmoud Ibraheem**

Abstract

\Background: Anemia is a severe complication of chronic kidney disease (CKD) that is seen in more than 80% of patients with impaired renal function. Hepcidin, an acute phase reactant protein produced in the liver, is a key regulator of iron homeostasis. **Aim of the Work:** to assess hepcidin level in 45 non-dialysis patients (CKD stage IV and V with negative virology) and its relation to iron parameters. **Patients and Methods:** A cross sectional study was conducted at Nasser Institute for Treatment and Research on 45 patients with chronic kidney disease stage IV and V. All patients included in this study were subjected to the following: Careful history taking, full clinical examination and proper laboratory investigations. **Results:** A statistically significant difference was found between CKD stage 4 and stage 5 according to Hb., iron, TIBC, Ferretin, serum and CRP. Also, there was a significant positive correlation of serum hepcidin with serum ferretin and hsCRP, while Hb and iron were significantly negatively correlated with hepcidin. We found statistically significant decrease in Hb level, serum Iron level, and TIBC in CKD stage 5 less than stage 4. We found statistically significant increase in Hepcidin level, serum ferritin, and hsCRP in CKD stage 5 more than stage 4. We found statistically significant Positive correlation between serum hepcidin with serum ferretin among patients with CKD stage 4 and 5. We found statistically significant Positive correlation between serum hepcidin with hsCRP among patients with CKD stage 4 and 5. **Conclusion:** Elevated hepcidin can predict the need for parenteral iron to overcome hepcidin-mediated iron-restricted erythropoiesis and need for relatively higher rhEPO doses to suppress hepcidin in CKD patients with negative viral markers.

Key words: hepcidin, iron status, chronic kidney disease, negative virology

Introduction

Anemia is a severe complication of chronic kidney disease (CKD) that is seen in more than 80% of patients with impaired renal function (*Simon and Nakhoul, 2016*).

Although there are many mechanisms involved in the pathogenesis of anemia of renal disease, the primary cause is the inadequate production of erythropoietin by the damaged kidneys (*Hasan et al., 2017*).

Adequate iron stores are essential for achieving maximum benefit from erythropoietic agents, such as recombinant human erythropoietin (rhEPO) or darbepoetin alfa. Decreased iron stores or decreased availability of iron are the most common reasons for resistance to the effect of these agents (*Jelkmann, 2013*).

Hepcidin, an acute phase reactant protein produced in the liver, is a key regulator of iron homeostasis. Hepcidin inhibits intestinal iron absorption and iron release from macrophages and hepatocytes. Because hepcidin productions increased by inflammation, and high hepcidin concentrations limit iron availability for erythropoiesis, hepcidin likely plays a major role in the anemia of inflammation and rhEPO resistance (*Singh, 2007*). Serum levels of prohepcidin, the precursor molecule of hepcidin, were found lower in patients with chronic HCV infection (*Ganz and Nemeth, 2012*).

Because of its renal elimination and regulation by inflammation, it is possible that progressive renal insufficiency leads to altered hepcidin metabolism, subsequently affecting enteric absorption of iron and the availability of iron stores (*Ashby et al., 2017*).

Several studies have shown elevated hepcidin levels in CKD, and it is now considered to be the critical link between inflammation and anemia in CKD patients (*Jairam et al., 2010*).

Treatment with agents that lower serum hepcidin levels or inhibit its actions may be an effective strategy for restoring normal iron homeostasis and improving anemia in CKD patients (*Tsuchiya & Nitta, 2013*).

Aim of the Work

The aim of this work is to assess hepcidin level in non-dialysis patients (CKD stage IV & V) with negative virology and its relation to iron parameters.
