Assessing Visitors' Interaction Using Virtual Reality in Dynamic Daylit Exhibition Spaces

A thesis Presented in Partial Fulfillment of the Requirements for Doctor
of philosophy Degree in Architecture Engineering

By

Fatma Mohamed Fathy Ahmed Abdelaziz

M.Sc. in Architecture 2016- Ain Shams University

Under Supervision of

Professor Dr. Yasser Mohamed Mansour

Professor of Architecture
Ain Shams University

Professor Dr. Hanan Mostafa Kamal Sabry

Professor of Architecture and Environmental Control
Ain Shams University

Professor Dr. Mostafa Refat Ismail

Professor of Architecture
Ain Shams University

2020

Ain Shams University
Faculty of Engineering
Department of Architecture Engineering

Name: **Fatma Mohamed Fathy Ahmed AbdelAziz**

Title: **Assessing Visitors' Interaction Using Virtual Reality in Dynamic Daylit Exhibition Spaces**

Degree: **Doctor of Philosophy in Architecture**

The Jury Committee:

Professor Dr. Yasser Hosny Sakr

Professor of Architecture

Former President, Helwan University

Professor Dr. Samir Sadek Hosny

Professor of Architecture

Department of Architecture

Faculty of Engineering - Ain Shams University

Professor Dr. Yasser Mohamed Mansour

Professor of Architecture

Faculty of Engineering - Ain Shams University

Professor Dr. Hanan Mostafa Kamal Sabry

Professor of Architecture and Environmental Control

Faculty of Engineering - Ain Shams University

Post Graduate studies

Disclaimer

This thesis is submitted as partial fulfillment of PhD degree in Architecture, Faculty of Engineering, Ain Shams University.

The work included in this thesis was carried out by the author during the period from November 2017 to June 2020, and no part of it has been submitted for a degree or qualification at any other scientific entity.

The candidate confirms that the work submitted is her own and that appropriate credit has been given where reference has been made to the work of others.

Name: Fatma Mohamed Fathy Ahmed

Acknowledgements

To my dear professors; Prof. Dr. Yasser Mansour, Prof. Dr. Hanan Sabry and Prof. Dr. Mostafa Refat, it will always be my honor to be your student. Thank you for your support, encouragement, vision and guidance. I pride myself on working under your supervision.

To my friends and colleagues at ASU, thank you for supporting me and pushing me forward. Heba, Hussein, Muhammad, Nada, Mai, Dalia, Aya, Rana, Mohamed, Mirna, Menna and Hazem, I appreciate your insights on the experiment and sharing your feedback and comments with me.

To Dr. Ayman Wagdy thank you for your generous feedback and insights. Sharing your expertise and your tips and tricks in the simulation and Matlab were invaluable.

To the team of the VR lab (CVS3) in FoE ASU, Eng. Sheirf El-Nabarawy, Eng. Abanob Samir, Eng. Ehab Naguib, Eng. Mai Mostafa, and Eng. Nermeen. Thank you for your support. It has been a great experience that you provided me in 3D scanning, photogrammetry and VR. I appreciate giving me your time and experience you shared with me. To Eng. Mohamed Abdelfattah and Eng. Eslam El-Mohandes, I am grateful for your help and patience in writing the head tracking code script in Unity.

To my family, thank you for everything you made for me. I believe that I wouldn't have reached this point without you.

Abstract

The inherent dynamics of daylight shape our experience and form our perceptions of the space. Daylighting performance assessment is both quantitative regarding their prediction methods and qualitative in terms of its impact on the intrinsic subjectivity of human interactions. Research in this field has interdisciplinary nature as it integrates light physics and psychological dimensions to understand the impact of light quality and quantity on the indoor space, hence on the human perception and their interactive level with the space.

Interactivity is a state of action within a space. It provokes the user's perceptions and behaviors in response to design stimuli. The dynamic changes in these stimuli (design actions) impact the interrelation of design actions and users' responses, so finding this relation is important for making decisions that urges the transfer of intended meanings of the space.

Exhibitions are characterized by a high level of meaning-making. Visual features and lighting measures can manipulate space cognition. So, lighting design act as a cornerstone in the design process of exhibition spaces due to its vital role in meaning-making and visitors experiences. The purpose of an exhibition space is to elaborate and signify the objects it holds and attract visitors to explore them. Thus, grabbing the attention of visitors needs to be understood under various lighting conditions. Focusing on daylighting, the influence of luminance and contrast variations on human visual interaction is recognized in this research.

Visual attention can be analyzed through heatmaps showing areas of interest (AoI) in the space. Head tracking in Virtual Reality (VR) can reveal what is behind subconscious interaction with the environment. It gives a better interpretation of how a person interacts with different messages in the environment. Unbiased behaviors can then be captured to extract objective data to build upon. The benefit of the immersive VR environment is allowing any type of simulated environment where visual stimuli with different scenarios can be repeated and controlled while giving a sense of presence. Finding the underlying relationship between qualitative daylighting aspects that urges visual attention of users and induces their subjective perceptions is not a straightforward process. So, this thesis provides an approach to assess and predict the interaction of visitors of the exhibition space through VR and Machine Learning (ML) algorithms.
