

# **Ultrasonographic Evaluation of Bowel Wall Thickness and Intramural Blood Flow in Ulcerative Colitis**

Thesis

Submitted for Partial Fulfilment of Master  
Degree  
in **Internal Medicine**

By

*Hazem Mohamed Abd Elazim Marey*  
*M.B.B.Ch*

Under Supervision of

**Dr. Moataz Mohamed Sayed**

*Professor of Internal Medicine*  
*Faculty of Medicine, Ain Shams University*

**Dr. Kamal El-Deen Abdelrahman El-Atrebi**

*Consultant Physician and Gastroenterologist*  
*NHTMRI*

**Dr. Tari Magdy Aziz George**

*Lecturer of Internal Medicine*  
*Faculty of Medicine, Ain Shams University*

# Acknowledgments

*First and foremost, I feel always indebted to **Allah** the Most Beneficent and Merciful.*

*I wish to express my deepest thanks, gratitude and appreciation to **Dr. Moataz Mohamed Sayed**, Professor of Internal Medicine, Faculty of Medicine, Ain Shams University, for his meticulous supervision, kind guidance, valuable instructions and generous help.*

*Special thanks are due to **Dr. Kamal El-Deen Abdelrahman El-Atrebi**, Consultsant Physician and Gastroenterologist, NHTMRI, for his sincere efforts, fruitful encouragement.*

*I am deeply thankful to **Dr. Tari Magdy Aziz George**, Lecturer of Internal Medicine, Faculty of Medicine, Ain Shams University, for her great help, outstanding support, active participation and guidance.*

*I would like to express my hearty thanks to all my family for their support till this work was completed.*

**Hazem Mohamed Abd Elazim Marey**

## ABSTRACT

**Background:** Ulcerative colitis, a type of inflammatory bowel disease that merely affects the mucosa and submucosa of colon in the form of inflammatory ulcers. **Objectives:** Our study aimed to provide an extensive overview of the main pathologic features of gut wall vessels and bowel wall thickness at US examination of UC. **Patients and Methods:** This prospective case control study was done on 40 patients confirmed to have UC attending to Outpatient Clinics of Internal Medicine and Gastroenterology Department – Ain-Shams University from October 2018 to August 2019.. **Results:** The peak incidence of affected patients was 30–40 years of age. Female predominance compared to male with a ratio of 2.6:1. 20% of remission patients complaining from 1-2 bowel movement while 45% and 50% of relapsing patients suffer from 3-4 and 5 bowel movement respectively. 100%, 100%, 20% and 15% of relapsing patients suffer from bleeding per rectum, abdominal pain, tenesmus and urgency. Higher ESR and CRP and lower hemoglobin in relapsing compared to remission group. Furthermore, The last group has higher value of ESR and CRP and lower value of hemoglobin compared to control group. BWT was significantly thicker in relapse group ( $4.8\pm 0.7$  mm) than of remission ( $3.55\pm 0.5$  mm) compared to control group ( $1.6\pm 0.5$ ) (p value  $<0.001$ ). BWT at a cut-offs  $> 4$  mm discriminating between cases with relapse from those with remission and at a cut-offs  $>4$  mm discriminating between mild endoscopic severity from moderate and severe UC. Furthermore, BWT at a cut-offs  $>4.6$  mm discriminating between mild and moderate endoscopic severity from severe UC. Vascular signal number at a cut-offs  $>1$  discriminating between cases with relapse from those with remission and at a cut-offs  $>2$  discriminating between mild and moderate endoscopic severity of UC.

**Conclusion:** Abdominal ultrasound is a widely available non-invasive method for imaging of UC. It provides a high sensitivity, specificity and accuracy in diagnosis and monitoring of UC activity.

**Keywords:** Ultrasonographic, Bowel Wall Thickness, Intramural Blood Flow, Ulcerative Colitis

## INTRODUCTION

Ulcerative colitis (UC) is a chronic inflammatory bowel disease (IBD) characterized by alternating periods of remission and relapse (*Orda's et al., 2012*).

As UC is a disease affecting the superficial layers of colonic wall, mucosal healing is, theoretically, a more achievable result of therapy compared with the transmural inflammation of Crohn's disease; thus, endoscopic response is often a target in clinical trials (*Parente et al., 2009*).

Accurate assessment of disease extent and activity is crucial for monitoring the clinical course and treatment response in patients with UC (*Kinoshita et al., 2019*).

Clinical symptoms alone are no longer acceptable as the sole indicator of disease activity, but should be used in combination with objective markers that assess inflammation (*Peyrin-Biroulet et al., 2015*).

Currently, colonoscopy is regarded as the most accurate objective measure of colorectal inflammation (*Dignass et al., 2012*).

Colonoscopy has limitations, however, such as cost, inconvenience, and invasiveness, making it unsuitable for frequent monitoring. It also has the risk of complications (e.g.,
