ملاحظات:

A Comparative Study between High Flow Nasal Oxygen Therapy and Venturi Mask Oxygen Therapy for Postoperative Laparoscopic Bariatric Surgery Patients with Atelectasis

Thesis

Submitted for Partial Fulfillment of M.D. Degree in Anesthesiology, Intensive Care and Pain Management

By

Asmaa Ahmed Nabeeh Negmeldin Abdelrahman Allam
M.B.B.Ch., M.Sc, Faculty of Medicine Ain Shams University

Under Supervision of

Prof. Dr. Galal Adel Mohamed Abdelreheem Elkady
*Professor of Anesthesiology, Intensive Care and Pain Management
Faculty of Medicine, Ain Shams University*

Asst. Prof. Dr. Mayar Hassan Sayed Ahmed Elserisi
*Assistant Professor of Anesthesiology, Intensive Care and Pain Management
Faculty of Medicine, Ain Shams University*

Asst. Prof. Dr. Mohamed Abdelsalam Aly Algendy
*Assistant Professor of Anesthesiology, Intensive Care and Pain Management
Faculty of Medicine, Ain Shams University*

Dr. Amr Fouad Hafez Helmy
*Lecturer of Anesthesiology, Intensive Care and Pain Management
Faculty of Medicine, Ain Shams University*

*Faculty of Medicine
Ain Shams University
2022*

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قالوا

سبحانك لا علم لنا
إلا ما علمتنا إنك أنت
العليم العليم

صدق الله العظيم

سورة البقرة الآية: ٣٢

Acknowledgments

*First and foremost, I feel always indebted to **Allah** the Most Beneficent and Merciful.*

*I would like to express my thanks and appreciation to **Prof. Dr. Galal Adel Moammed Abdelreheem Elkady**, Professor of Anesthesiology, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for his opinions, timely feedback, insights and the effort and time he has devoted to the fulfillment of this work. I am indebted to his meticulous follow-up and constructive criticism.*

*I would also like to thank, **Asst. Prof. Dr. Mayar Hassan Sayed Ahmed Elseri**, Assistant professor of Anesthesiology, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for the efforts and time to accomplish this work.*

*I can't forget to thank with all appreciation, **Asst. Prof. Dr. Mohammed Abdelsalam Aly Algendy**, Assistant professor of Anesthesiology, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for his great efforts and time he has devoted to accomplish this work.*

*I would like also to thank **Dr. Amr Fouad Hafez Helmy**, Lecturer of Anesthesiology, Intensive Care and Pain Management, Faculty of Medicine, Ain Shams University, for his valuable role in the practical part of this work.*

*Last but not least, this work is dedicated to all our **patients**, without them, this work would have been of no value, and also to my **colleagues** for their support and care in every step of my career.*

I can't forget to thank all members of my family, especially my Parents, for the support and care in every step of my life.

Asmaa Ahmed Nabeeh Negmeldin Abdelrahman Allam

List of Abbreviations

Abb.	Full term
2D	Two dimensional
ALI.....	Acute lung injury
ARDS.....	Acute respiratory distress syndrome
ASA.....	American Society of Anesthesiologists
BLUE protocol	Bedside lung US in emergency
BMI.....	Body Mass Index
cmH ₂ O	Centimeter Water
CO ₂	Carbon Dioxide
CPAP	Continuous positive airway pressure
CT scan.....	Computerized tomography
CXR	Chest X-ray
ERV	Expiratory reserve volume
FiO ₂	Fraction of Inspired Oxygen
FRC	Functional Residual Capacity
GA.....	General Anaesthesia
HFNO ₂	High Flow Nasal Oxygen
IAP.....	Intra-abdominal pressure
ICU	Intensive Care Unit
Kg/ m ²	Kilogram / meter square
L/Min	Liters / minute
LLL.....	Left lower lobe
LUL	Left upper lobe
Lung US	Lung Ultrasound
m RAS	modified radiological atelectasis
mm Hg.....	Millimeters Mercury
NIV	Non-invasive ventilation
OHS	Obesity hypoventilation syndrome

List of Abbreviations cont...

Abb.	Full term
OR.....	Operating room
OSA	Obstructive Sleep Apnea
PaCO ₂	Partial Pressure of Carbon Dioxide in arterial blood
PaO ₂	Partial Pressure of Oxygen in arterial blood
PaO ₂ / FiO ₂	Partial Pressure of Oxygen / Fraction of Inspired Oxygen
PEEP	Positive end-expiratory pressure
RLL.....	Right lower lobe
RML.....	Right middle lobe
RUL	Right upper lobe
VMO ₂	Venturi Mask Oxygen

INTRODUCTION

Obesity is expressed as Body Mass Index (BMI) which is the weight in Kilograms divided by the height in square meters (Kg/m^2) of more than 30. Obesity is associated with multiple comorbidities, one should pay attention to the respiratory complications. It affects lung volumes causing restrictive pattern and decreases the Functional Residual Capacity (FRC) to the point that is less than the closing volume resulting in atelectasis and hypoxemia. Obesity also increase the minute ventilation and hence work of breathing, decreases lung compliance and increases airway resistance. It can result in obstructive sleep apnea (OSA) (*Hines et al., 2018*).

Obesity combined with postoperative respiratory muscle dysfunction may lead to respiratory failure. As a result, obesity is associated with a higher risk of postoperative hypoxemia (*Stéphan et al., 2017*).

Baltieri et al. (2016) reported a 37 percent prevalence of atelectasis in obese patients after bariatric surgery in a retrospective observational study. Respiratory complications, on the other hand, are not uncommon in the general surgical population and have been demonstrated to lengthen hospital stays and increase death (*Fulton et al., 2018*).

High Flow Nasal Oxygen (HFNO_2) therapy provides warmed humidified oxygen and low-level, flow-dependent positive airways pressure, and may be more tolerable than Continuous positive airway pressure (CPAP) or non-invasive

ventilation; also, HFNO₂ improves washout of nasopharyngeal dead space, resulting in improved oxygenation. In giving prophylactic support to preterm newborns after extubation, HFNO₂ has been demonstrated to be both safe and non-inferior to standard CPAP with lower incidence of nasal trauma than in the CPAP group. When compared with standard care, prophylactic postoperative high-flow nasal oxygen reduced hospital length of stay and intensive care unit re-admission (*Zochios et al., 2018*).

HFNO₂ therapy involves the continuous delivery of up to 60 L/min with optimal heat and humidity through a nasal cannula. Interestingly, HFNO₂ improves oxygenation by increasing both end-expiratory lung volume and tidal volume and is most beneficial in patients with higher BMI (Body Mass Index) (*Stéphan et al., 2017*).

The incidence of obesity (defined by a body mass index (BMI) 30 kg/m²) is increasing worldwide. In selected individuals, bariatric surgery may offer a means of achieving long-term weight loss, improved health, and healthcare cost reduction. Physiological changes that occur because of obesity and general anesthesia predispose to respiratory complications following bariatric surgery (*Fulton et al., 2018*).

According to *Hernández et al. (2016)* among high-risk adults who have undergone extubation, high flow conditioned oxygen therapy was not inferior to NIV for preventing re-intubation and post-extubation respiratory failure. High-flow conditioned oxygen therapy may offer advantages for these patients.

AIM OF THE WORK

The aim of this study is to compare the clinical outcome of treating postoperative laparoscopic sleeve gastrectomy surgery patients having atelectasis by using High Flow Nasal Oxygen Therapy versus Venturi Mask Oxygen Therapy.

OXYGEN DELIVERY SYSTEMS

They are classified into low-flow (or variable performance) and high-flow (or fixed performance) systems. Low-flow systems provide small amounts of 100 % oxygen as a supplement, with FiO_2 determined by the patient's pattern of breathing and minute ventilation. The greater portion of the inspired volume is obtained from room air. High-flow systems are designed to supply premixed oxygen in volumes that provide the patient's total ventilatory requirements. An advantage of high-flow systems is that the level of FiO_2 remains constant regardless of any changes that may occur in the ventilatory pattern (*Villanueva et al., 2016*).

Low-Flow Systems

Low-flow oxygen devices are characterized by simplicity and ease of use, healthcare providers' familiarity with the system, low cost, and patient acceptance (*Villanueva et al., 2016*).

Table 1: Flow rates and FiO₂ with low-flow oxygen delivery device, Predicted FiO₂ values for low-flow systems assume a normal and stable pattern of ventilation (*Villanueva et al., 2016*)

Low-flow system	Oxygen flow rates (L)	FiO ₂
Nasal cannula	1	0.24
	2	0.28
	3	0.32
	4	0.36
	5	0.40
	6	0.44
Simple face mask	5- 6	0.40
	6- 7	0.50
	7- 8	0.60
Partial re-breathing mask	6	0.60
	7	0.70
	8	0.80
	9	0.80 +
	10	0.80 +
Non-rebreathing mask	10	0.80 +
	15	0.90 +

Standard nasal oxygen cannula

It is the most frequently used low-flow oxygen delivery system consists of a pronged nasal cannula (Figure 1) to deliver 100 % oxygen at flow rates of 0.5–6 L/min, delivering a FiO₂ ranging from 0.24 to 0.40. Patients generally cannot tolerate an oxygen flow rate of more than 6 L/min from the nasal cannula because of nasal discomfort. If the oxygen flow rate exceeds 4
