The Effect of Tunnel versus Conventional Phototherapy on the T Lymphocytes in Full Term Neonates with Hyperbilirubinemia

Thesis

Submitted for Partial Fulfillment of Master Degree
in Pediatrics

By

Ahmed Mohammed Ali Saleh

M.B.B.CH 2007- Pediatrics Diploma (2015)

Ain Shams University

Under Supervision of

Prof. Dr./ Mona Mostafa El-Ganzoury

Professor of Pediatrics

Faculty of Medicine, Ain Shams University

Prof. Dr./ Rania Ali El-Farrash

Professor of Pediatrics

Faculty of Medicine, Ain Shams University

Dr. Dalia Ahmed Diaa El Dine Salem

Assistant Professor of Clinical Pathology

Faculty of Medicine, Ain Shams University

Faculty of Medicine

Ain Shams University

2022

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قالوا

سبحانك لا علم لنا
إلا ما علمتنا إنك أنت
العليم العليم

صدق الله العظيم

سورة البقرة الآية: ٣٢

Acknowledgment

*First and foremost, I feel always indebted to **Allah**,
the Most Kind and Most Merciful.*

*I'd like to express my respectful thanks and
profound gratitude to **Prof. Dr./ Mona Mostafa
El-Ganzoury**, Professor of Pediatrics, Faculty of
Medicine, Ain Shams University, for her keen guidance,
kind supervision, valuable advice and continuous
encouragement, which made possible the completion of
this work.*

*I am also delighted to express my deepest
gratitude and thanks to **Prof. Dr./ Rania Ali El-Farrash**,
Professor of Pediatrics, Faculty of Medicine, Ain
Shams University, for her continuous supervision,
valuable instructions, constant help and great
assistance throughout this work.*

*I am deeply thankful to **Prof. Dalia Ahmed Diaa
El Dine Salem**, Assistant Professor of Clinical
Pathology Faculty of Medicine, Ain Shams
University, for her great help, active participation
and guidance.*

 *Ahmed Mohammed Ali Saleh*

Abstract

Background: Neonatal jaundice is one of the most common conditions. Phototherapy has been accepted as the standard treatment for neonatal jaundice and the decline in the number of exchange transfusions in recent years is, at least in part, likely a direct reflection of the effectiveness of phototherapy at treating hyperbilirubinemia. However, this treatment modality also has some complications. One possible harmful consequence is potential immunotoxic effects by affection of lymphocytes subtypes which can affect the immune system functions in infants. **Aim of the Work:** current study was performed to compare the effect of both conventional and tunnel phototherapy on lymphocytes subsets in term neonates (≥ 37 weeks) with unconjugated hyperbilirubinemia. **Patients and Methods:** The present study was conducted on 60 term neonates (≥ 37 weeks) 40 of them with unconjugated hyperbilirubinemia admitted to NICUs in Ain-Shams University hospital during the period from January 2019 to July 2019. They were randomly assigned to 3 groups: 20 patients were exposed to conventional phototherapy and 20 patients were exposed to tunnel phototherapy and the other 20 healthy full term were assigned as control group. Total serum bilirubin (TSB), direct serum bilirubin (DSB), CBC, CD4 and CD8 percentages and absolute count were measured before and 48 h after phototherapy in the phototherapy groups. Baseline lab was done in the control group at once. **Results:** significant decrease in total and direct bilirubin post-phototherapy in both phototherapy groups proved that *tunnel* phototherapy is as effective as conventional phototherapy as both provided rapid decrease in bilirubin levels. As regards the effect of phototherapy on lymphocytic count, we found that lymphocytic count significantly decreased post-phototherapy in both phototherapy groups. As regards the effect of phototherapy on CD4+ and CD8+ percentages, we found that CD4+ % significantly decreased post-phototherapy in conventional phototherapy group. Moreover, when we measured CD4+ and CD8+ absolute counts, we found that CD4+ and CD8+ absolute counts significantly decreased post-phototherapy in both phototherapy groups. In the view of the effect of phototherapy on CD4/CD8 ratio, we found that the ratio significantly increased in tunnel phototherapy group. **Conclusion:** Conventional and Tunnel phototherapy which are used in the treatment of neonatal hyperbilirubinemia, affects the function of the immune system in newborns via alterations in CD4+ and CD8+ absolute counts.

Key words: Tunnel, conventional Phototherapy, T Lymphocytes, Full-term Neonates, Hyperbilirubinemia

Introduction

Neonatal jaundice is one of the most common condition that requires medical attention in newborns as approximately 60% of term and 80% of preterm newborns suffer from jaundice in the first week of life (*Brits et al., 2018*).

The yellow discoloration of the skin and sclera in newborns with jaundice is the result of accumulation of unconjugated bilirubin. In most infants, unconjugated hyper-bilirubinemia reflects a normal transitional phenomenon. However, in some infants, serum bilirubin levels may excessively rise which can be a cause for concern (*El Mashad et al., 2019*).

Phototherapy is the primary treatment in neonates with unconjugated hyperbilirubinemia. This therapeutic principle was discovered in England in the 1950s and is the most widespread therapy used in newborns (*Mreihil et al., 2010*). It involves exposing the infant's skin to light of specific wavelength (420-470 nm) (*Jahanshahifard et al., 2012*).

Its efficacy is dependent on the color (wavelength) and intensity (irradiance) of the light emitted during phototherapy, the exposed body surface area as well as the duration of the exposure (*Kanmaz et al., 2017*).
