***Assessment of Remineralization of Artificially
Demineralized Enamel Lesions using Different
Remineralizing Approaches at Different Time
Intervals***

Thesis Submitted to Operative Department,
Faculty of Dentistry Ain Shams University
For Partial Fulfillment of the Requirements of Doctor Degree
In Operative Dentistry

By

By

Maha Salah Abd El-latif Mostafa

B.D.Sc. Faculty of Dentistry, Ain Shams University, 2009

M.Sc Faculty of Dentistry, Ain Shams University, 2015

Assistant Lecturer of Operative Dentistry, Faculty of Dentistry,
Ain Shams University

2022

Supervisors

Dr. Khaled Ali Nour

Assistant professor of Operative Dentistry
Faculty of Dentistry, Ain Shams University

Dr. Mohammed Nasser Mohammed Anwer

Lecturer of Operative Dentistry
Faculty of Dentistry, Ain Shams University

Dr. Hooi Pin Chew

Associate Professor-Faculty of Dentistry, MDRCBB
University of Minnesota, United States of America

Acknowledgement

*My deepest gratitude to my supervisor, **Prof. Dr. Khaled Ali Nour**. I have been fortunate to have an advisor who taught me how to question thoughts and express ideas. His insightful comments and constructive criticisms helped me focus my ideas.*

*I wish to express my sincere appreciation and gratitude to my co-supervisor, **Dr. Mohammed Nasser Mohammed Anwer**, who has been always there to listen and give advice. His patience and support helped me finish this study.*

*My dear supervisor **Dr. Hooi Pin Chew**, I am to her grateful for being always, supporting, guiding, and advising throughout my work in the University of Minnesota.*

*To **Mom and Dad.** A million Words would be too short for your love and care through my entire life.*

*To my sister, brother-in-law, and nephew
Thank you for being there in every step of the way.*

*To my **Professor Dr.Mokhtar Nagy**
May Allah have mercy on him and place him into
heavens.*

List of Tables

Table 4.1: Trade names, chemical composition, application, and manufacturers of the experimental materials.	51
Table 4.2: Chemical composition and duration used for the pH cycling solutions.....	52
Table 5.1: Descriptive statistics and results of Mann-Whitney U test and Independent t test for comparison between lesion severity (48 and 72 hrs.) effect on the four remineralizing agents.	81
Table 5.2: Descriptive statistics and results of Friedman’s test for comparison between lesion depths measured with Micro-Ct through de/remineralization process in lesions induced after 48 hours.	89
Table 5.3: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	89
Table 5.4: Descriptive statistics and results of Friedman’s test for comparison between lesion depths measured with Micro-Ct through de/remineralization process in lesions induced after 72 hours	90
Table 5.5: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	90
Table 5.6: Descriptive statistics and results of Friedman’s test for comparison between Interprismatic demineralization depth IPD _{OCT} after de/remineralization process in lesions induced after 48 hours.	92
Table 5.7: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	92
Table 5.8: Descriptive statistics and results of Friedman’s test for comparison between Interprismatic demineralization depth IPD _{OCT} after de/remineralization process in lesions induced after 72 hours.	93
Table 5.9: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	93

Table 5.10: Descriptive statistics and results of Friedman’s test for comparison between lesion mean mineral density (ΔZ) after de/remineralization process in lesions induced after 48 hours.	95
Table 5.11: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	95
Table 5.12: Descriptive statistics and results of Friedman’s test for comparison between lesion mean mineral density after de/remineralization process in lesions induced after 72 hours.	96
Table 5.13: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	96
Table 5.14: Descriptive statistics and results of Friedman’s test for comparison between Integrated Reflectivity after de/remineralization process in lesions induced after 48 hours	98
Table 5.15: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	98
Table 5.16: Descriptive statistics and results of Friedman’s test for comparison between Integrated Reflectivity after de/remineralization process in lesions induced after 72 hours.	99
Table 5.17: Dunn’s test for pairwise comparisons for significant Friedman’s test values.....	99
Table 5.18: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 48 hrs. for the Lesion depth measured with Micro-Ct (LD_{MCT}).....	102
Table 5.19: Dunn’s test for pairwise comparisons for significant Kruskal-Walli’s test values.	102
Table 5.20: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 48 hrs. for the Lesion depth measured with OCT outcome measure (IPD_{OCT}).....	104

Table 5.21: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 48 hrs. for the mean grey value outcome measure measured with Micro-Ct (ΔZ_{200}).	107
Table 5.22: Dunn's test for pairwise comparisons for significant Kruskal-Wallis test values.	107
Table 5.23: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 48 hrs. for the integrated reflectivity outcome measure measured with OCT (IR_{20-100}).	109
Table 5.24: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 72 hrs. for the Lesion depth measured with Micro-Ct outcome measure (LD_{MCT}).	112
Table 5.25: Dunn's test for pairwise comparisons for significant Kruskal-Wallis test values	112
Table 5.26: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 72 hrs. for the Lesion depth measured with OCT outcome measure (IPD_{OCT}).	115
Table 5.27: Dunn's test for pairwise comparisons for significant Kruskal-Wallis test values.	115
Table 5.28: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 72 hrs. for the mean grey value outcome measure measured with Micro-Ct (ΔZ_{200}).	117
Table 5.29: Descriptive statistics and results of Kruskal-Wallis test for comparison of rate of remineralization between different remineralizing agents in lesions induced after 72 hrs. for the integrated reflectivity outcome measure measured with OCT (IR_{20-100}).	119

Table 5.30: Descriptive statistics and results of Wilcoxon Signed Rank test for comparison between the end of the 12 pH-Cycles and the DMII time points in lesions induced after 48 hours.	123
Table 5.31: Descriptive statistics and results of Wilcoxon Signed Rank test for comparison between the end of the 12 pH-Cycles and the DMII time points in lesions induced after 72 hours.	124
Table 5.32: Results of Spearman's' correlation coefficient for the correlation between lesion depth for Micro-Ct and OCT and ΔZ and the IR.....	129

List of Figures

Figure 2.1: Schematic representation of Enamel hierarchy. The tooth and-supporting structure (a). Enamel structure (b.) Rod structure (c) ⁽³⁴⁾	7
Figure 2.2: Micro computed tomography (Micro-Ct) setup. ⁽⁸⁴⁾	20
Figure 2.3: Schematic illustration of swept source optical coherence tomography (SS-OCT) system. Near-infrared laser is emitted and divided into a signal and a reference beam. Reference light and backscattered light from the sample are recombined by a second fiber. ⁽¹⁰⁰⁾	22
Figure 2.4: Diagrammatic representation of A-scans and B-scans direction within the cross-sectional slice of sample investigated.	24
Figure 2.5: 3D OCT tomographic image of occlusal surface (a). The B-scan image shows the position and depth and the magnitude of the reflectivity light at each pixel (d). Two A-scans of reflectivity vs. depth are presented in the sound and demineralized areas ⁽⁸⁰⁾	24
Figure 2.6: OCT B-scans of buccal surface of crown generated with default grey value and different color map for better visualization.	25
Figure 2.7: Schematic diagram representing stages of amelogenesis presecretory, secretory, transition, maturation, and post maturation stage ⁽¹⁵⁸⁾	37
Figure 2.8: (a) The amino acid sequence of P11-4. The sidechains are labelled according to the peptide back. (b) Schematic presentation of the self-assembling process. ⁽¹⁶⁸⁾	39
Figure 4.1: Swept-source OCT (SS-OCT) setup used in this study, high speed scanning laser source (a), handheld probe in a holder (b), microscope stage (c), computer display(d).	44
Figure 4.2: SS-OCT B-scan at intensity threshold 21-28 dB of specimen (a) with no subsurface demineralization and (b) with subsurface demineralization.	45

Figure 4.3: Isomet used to cut samples occluso-gingivally in mesio-distal direction under running water.....	46
Figure 4.4: Customized acrylic mold used to mount samples using self-cured acrylic resins.....	46
Figure 4.5: Mounted specimen with whole crown painted with acid resistant nail varnish except for the region of interest that is identified by the four corner holes (white arrows) prepared with carbide bur.	47
Figure 4.6: Diagram represents the experimental groups.	50
Figure 4.7: Customized jig used to standardize sample position in the OCT (a). Representative view of the sample positioned on the microscope stage of OCT (b). White arrows point at the light beam from the probe of OCT.53	
Figure 4.8: Customized jig used to standardize sample position in the Micro-Ct (a). Representative view of an samples positioned on the turntable in the Micro-Ct chamber apparatus. White arrow point at the exit site of X-ray beam from the target of Micro-Ct (b).	54
Figure 4.9: Diagrammatic chart showing the experimental flow after artificial carious lesion formation.	56
Figure 4.10: The Micro-Ct machine used in this study. The red arrow points to the control panel used to operate and preview the sample position. The black arrow points to the chamber in which the sample is placed to be scanned.	58
Figure 4.11: A representative illustration of a 3D rendered Micro-Ct scan, showing the three planes: sagittal (red), coronal (green)and horizontal (blue). Ten frames were selected from the horizontal cross section.After super imposition of the volumes all five time points guided by the reference holes.....	60
Figure 4.12: A representative illustration of the extracted ten frames from each time point using the horizontal cross section view.....	60
Figure 4.13: Operations for the measurement of mean lesion depth: (a) Surface determination and segmentation of the lesion; (b) Annotation of the lateral	

limits of the ROI using the co-ordinates from the MS Paint software; (c) Computation of the normal distances between the surface and the boundary between the lesion and sound enamel.	63
Figure 4.14: Micro-Ct cross-section being processed, and surface aligned with MATLAB to generate mean mineral intensity line profile to compute ΔZ	64
Figure 4.15: Corresponding 3D reconstructed Micro-Ct scan (a-b) and OCT surface view of the same sample. Green and red horizontal lines detecting the ROI from which B-scans was selected and it corresponds to the green and red arrows on the 3D Micro-Ct scan.....	67
Figure 4.16: Processed B-scan file using the MATLAB software. Red and yellow color indicate the demineralized zone after removal of the background. Normal main angle of the surface was determined.	69
Figure 4.17: Blue line indicate the surface and red and yellow lines indicates the deepest pixel of the demineralized area.....	69
Figure 4.18: Processed images before (a) and after (b) surface alignment to be leveled with the highest point of the surface.	70
Figure 5.1: Horizontal Micro-Ct scan of sound enamel surface showing enamel (E), dentino- enamel junction (DEJ) and dentine (D).....	73
Figure 5.2: SS-OCT B-scan of sound enamel surface showing enamel (E), dentino-enamel junction (DEJ) and dentine (D). Region of interest (ROI) boundaries are demarcated with white dotted lines.....	73
Figure 5.3: Micro-Ct scans representing artificial carious lesion induced in enamel with buffered lactic acid after 48 hrs.(a) and 72 hrs.(b). Red arrow indicate consistent and continuous surface layer present in the 72 hrs. lesion (b).....	74
Figure 5.4: SS-OCT B-scans of enamel demineralization after 48 hrs. (1-a, b & c) and 72 hrs. (2-a, b & c). Different color maps used to enhance visualization of different intensity (dB) threshold (a) (b) (c). Red arrow pointing to surface layer formation in the 72 hrs. lesion.	75

- Figure 5.5:** Average relative mineral intensity line profiles of Micro-Ct scans of samples representing sound enamel, demineralized samples for 48 hrs. and 72 hrs. using buffered lactic acid pH 4.5 lactic acid. ΔZ represent the integrated mineral loss to depth for each line profile. 76
- Figure 5.6:** Average Intensity depth profiles of OCT A-scans of samples representing sound enamel, demineralized samples for 48 hrs. and 72 hrs. using buffered lactic acid pH 4.5 (IR) represents the integrated reflectivity to depth for each line profile. 77
- Figure 5.7:** Box plot showing the effect of lesion severity on different remineralizing agents on lesion depth reduction% using the Micro-Ct. * Represents the sig. difference between the 48 hrs. and 72 hrs. lesion for each remineralizing agent..... 82
- Figure 5.8:** Box plot showing the effect of lesion severity on different remineralizing agents on the % change of mean mineral density using the Micro-Ct. * Represent the sig. between the 48 hrs. and 72 hrs. lesion for each remineralizing agent..... 82
- Figure 5.9:** Box plot showing the effect of lesion severity on different remineralizing agents on Interprismatic demineralization depth reduction% using the OCT. * Represent the sig. between the 48 hrs. and 72 hrs. lesion for each remineralizing agent..... 83
- Figure 5.10:** Bar chart showing the effect of lesion severity on different remineralizing agents on Integrated reflectivity reduction% using the OCT. 83
- Figure 5.11:** Box plots showing change of the lesion depth using different remineralizing agents over different time points in 48 hrs. lesion. Black*showed significance change with (DMI) and Red*showed significance change with(6C). 91
- Figure 5.12:** Box plots showing change of the lesion depth using different remineralizing agents over different time points in 72 hrs. lesion. Black*showed significance change with (DMI) and Red*showed significance change with(6C). 91
