# **Evaluation of the effect of different finishing protocols on translucency and surface roughness of two different ceramic materials**

## **Thesis**

Thesis Submitted for the partial fulfillment of the Master Degree requirements in Fixed Prosthodontics,  
Faculty of Dentistry, Ain Shams University

By

**Omar Abd El Fattah El Didi**

B.D.S (2010)

**Faculty of Dentistry**

**Ein Shams University**

**2019**

# **Supervisors**

## **Prof. Tarek Salah Eldin Morsi**

Professor, Head of Fixed Prosthodontics Department

Faculty of Dentistry

Ain shams University

## **Dr. Ahmed Ezzat Sabet**

Associate Professor, Fixed Prosthodontics Department

Faculty of Dentistry

Ain shams University

## **ACKNOWLEDGEMENT**

First and foremost, I would like to thank God for helping me finish this work.

I would like to express my thanks, gratitude and appreciation to Professor **Tarek Salah Eldin Morsi**, Head Professor of Fixed Prosthodontics Department, Faculty of Dentistry, Ain Shams University, for his sincere and continuous assistance to me during my work in this research, he did not spare time or effort or knowledge for my help in Take out this work.

I would like to thank Dr. **Ahmed Ezzat Sabet**, Associate Professor of Fixed Prosthodontics, Faculty of Dentistry, Ain Shams University, for his great help and tireless effort throughout this work.

I would also like to thank all the staff and all my colleagues in the fixed dentistry department at the Faculty of Dentistry, Ain Shams University for their continued assistance, encouragement and continuous support.

# **DEDICATION**

To my family ..... thank you for unconditional love and support

To my professors and all staff of Fixed prosthodontics department –faculty dentistry- Ain shams university for your academic support all the way.

To my colleagues and friends ..... Thank you for the best times we spent together

I give you this Master's thesis .....

Calling upon the almighty to be crowned with success and acceptance by the members of the discussion committee.

# INTRODUCTION

---

## 1. INTRODUCTION

The appearance of natural teeth is best mimicked by ceramic materials. In recent years the popularity of all-ceramic dental restorations has increased due to their high esthetic qualities and metal-free structure. Significant developments in all-ceramic materials have created wonderful opportunities for the fabrication of lifelike restorations that provide reliable, long-term results<sup>1</sup>.

However, all-ceramic dental materials are inherently fragile in tension, affected by micro cracking, flaws, and defects that may be introduced during thermal treatment or fabrication procedures. The fabrication process precision, and skills of individual dental technicians, may affect the reliability and clinical performance of all-ceramic restorations<sup>1</sup>.

Mechanical properties such as strength and optical properties such as color and translucency are the first parameters assessed to understand the clinical potential and limits of dental ceramics.

Natural glaze is a glazed ceramic layer formed on the surface of porcelain, containing a glass phase when the porcelain is heated to the temperature of glaze for the time specified by the manufacturers. This layer may deteriorate with clinical modifications to the final restoration, leading to a coarse surface that resembles a pre-treated surface<sup>2</sup>.

Polishing has been shown to improve structural resistance to oral conditions and ensure visual properties of restoration. The transparency and strength of the slab and the veneer system can be seen in the ceramic system with natural enamel that has a transparency failure<sup>3</sup>.

# INTRODUCTION

---

The translucency of dental restorative material is usually determined by Contrast ratio (CR) or Transparency Parameters (TP). Translucency of dental ceramics materials is important for the esthetic quality of the dental restorations<sup>4</sup>.

All ceramic crowns allow for greater transfer of light through the crown and can mimic the appearance of natural teeth in terms of surface texture and trans-electivity. Differences in the transparency of the basic materials in the restoration process may affect final results<sup>5</sup>.

The objectives of this study were to determine the effects of different surface finishing protocols on the surface roughness and translucency of two different ceramic materials.
