Lifestyle Changes among Patients with Myocardial Infarction

Thesis

*Submitted for Partial Fulfillment of Master Degree in
Nursing Sciences
(Medical Surgical Nursing)*

**Under supervision of
Dr. / Manal Hussein Nasr**

Professor of Medical Surgical Nursing

Faculty of Nursing - Ain Shams University

Dr. / Basma Mohammed khalil

Assistant professor of Medical Surgical Nursing

Faculty of Nursing - Ain Shams University

**Faculty of Nursing
Ain shams University**

2022

Acknowledgement

First and foremost, I feel always indebted to Allah, the most kind and the most Merciful for all his blessings and for giving me the will and strength for completion of this work.

I would like to express my deepest thanks, sincere appreciation and most gratitude to **Dr. Mammal Hussein**, Professor of Medical Surgical Nursing, Faculty of Nursing, Ain Shams University, for encouraging me to proceed the subject I had chosen and for patiently putting up with my anxieties, for her precious advice, devoted time and effort, constructive guidance, assistance, fruitful criticism, and meticulous revision. Her influence on this work cannot be missed. I thank her for immense support and profound expertise.

I am deeply grateful to **Dr. Basma Mohammed Khalil**, Assistant professor of Medical Surgical Nursing, Faculty of Nursing, Ain Shams University, for her supervision, support, constructive guidance, assistance, fruitful criticism, her influence on this work cannot be missed. I thank her for immense support and profound expertise. I am deeply affected by her noble character, perfection, care and consideration.

I feel deeply thankful to all patients for their participation in this work, in addition to the health care workers for their help and support in conducting this thesis.

Last but not least, I am deeply grateful to my family, my husband and to all those who sincerely helped me to fulfill this work.

 **Aya Sobhy Fahmy Elkashef**

Lifestyle Changes among Patients with Myocardial Infarction

Abstract

Background: Myocardial infarction (MI), also known as a heart attack, occurs when blood flow decreases or stops to a part of the heart, causing damage to the muscle. **Aim of the study:** To assess life style changes among patients with MI through: assessing demographic data, patients knowledge about the disease, also assessing life style practices among patient with MI. **Study Design:** A descriptive exploratory research design was utilized. **Setting:** The study was conducted in the cardiac care unites at Ain shams university hospital. **Study Subjects:** A purposive sample of 100 patients with MI was included in the study. **Data Collection Tools:** Patients' structured interviewing questionnaire, Patients Level of Knowledge Questionnaire & Lifestyle Practices Questionnaire. **Results:** This study revealed that 53% of the studied patients had correct knowledge about definition of the disease and its causes. Also, 72% of them had unsatisfactory level of knowledge about myocardial infarction. Regarding to total physical lifestyle practices 70% of the studied patients have unhealthy physical lifestyle practices. Regarding to psychological state 62% of the studied patients always felt bad tempered and 65% of them were stressed. Regarding to social status 58% of the studied patients always have lack of motivation to think about the future. **Conclusion** Based on the findings of this study it can be concluded that near three quarters of the studied patients had un-satisfactory level of knowledge about MI and two thirds of them had un-satisfactory level of total knowledge regarding life style changes after MI. Even though the majority of studied patients were commitment to the treatment. This part had answered the first question. Also, three quarters of studied patients had un-healthy life style practices.. **Recommendations:** Include rehabilitation program must held for patients with MI to meet the needs (therapeutic regiment, follow up, exercise and dietary information after MI) and Coping strategies must be delivered for patients with MI about life style changes.

Keywords: Patients, Myocardial Infarction, Lifestyle.

Introduction

The most common type of Cardiovascular Disease (CVD) is Myocardial Infarction (MI), which is the outcome of coronary vessels occlusion and ischemia of myocardium. MI is a major cause of mortality among heart diseases. MI happens in the USA every 20 second and every minute one dies due to this disease. It is one of the main reasons for hospitalization of heart patients, which is usually assumed as a threatening situation for the patient and the family (*Marquis-Gravel et al., 2020*).

Myocardial Infarction (MI), is commonly known as a heart attack, is defined pathologically as the irreversible death of myocardial cells caused by ischemia. MI is a syndrome that can be recognized by a set of symptoms, chest pain being the hallmark of these symptoms in most cases, supported by biochemical laboratory changes, electrocardiographic (ECG) changes, or findings on imaging modalities able to detect myocardial injury and necrosis (*Chapman et al., 2020*).

Myocardial infarction occurs because of sustained ischemia, causing irreversible myocardial cell death (necrosis). When a thrombus develops, there is no blood
