Name: Sahr Badrawy Abdel Aziz Mahmoud

Nationality: Egyptian

Date of birth: 8/1/1990.

Place of birth: Qalubeia

Degree: Ph. D

Title of Thesis:

“Insights into the possible microbial challenges facing cultured tilapias in Egypt”

Under the Supervision of

Prof. Dr. Mohamed Sayed Mohamed Marzouk

Professor of Aquatic Animal Medicine and Management

Faculty of Veterinary Medicine, Cairo University.

Prof. Dr. Nermeen Mostafa Mohamed

Professor of Aquatic Animal Medicine and Management, Faculty of Veterinary Medicine, Cairo University.

Dr. Nehal Abou-Elkaramat Younis

Associate Professor of Aquatic Animal Medicine and Management Faculty of Veterinary Medicine, Cairo University.

Prof. Dr. Hossam Hassan Abbas

Prof. of Aquaculture, Veterinary Research Institute, National Research Centre, Dokki, Giza

Abstract

In the last few years there were episodes of colossal mortalities in tilapia fish farms during summer season. This study was intended to investigate the possible microbial causes of such mortalities. A total of 250 moribund fish samples were collected from Kafr El-Sheikh, Sharqia and El Fayoum governorate. The most apparent clinical signs were hemorrhagic patches and darkness on skin, protruded vent, exophthalmia, and abdominal distension. The postmortem findings were enlarged, friable spleen and liver, abscesses, serosanguinous ascitic fluid and enlarged gallbladder. The molecular identification of Tilapia Lake Virus by PCR confirmed the absences of the virus in all examined samples collected from Kafr El-Sheikh governorate. A total of 48 pathogenic bacterial isolates were retrieved from the infected fish. Namely, *Streptococcus agalactiae* (14), *Enterococcus faecalis* (10),

Lactococcus garvieae (10), *Streptococcus dysgalactiae* (9), *Aeromonas hydrophila* (3), and *Vibrio cholera* (2). The predominance of Streptococci infections points to its intense involvement in such mortalities. All isolates were confirmed by 16s rRNA gene sequencing and phylogenetic analysis. The molecular screening confirmed the existence of *Hyl*, *cylE*, *scpB* and *camp* genes in all *S. agalactiae* strains. *E. faecalis* isolates possessed *Hyl* (50%), *Asa1* (40%), *CylA* (70%), *GelE* (60%), *Esp* (50%), *EF3314* (50%) and *Ace* (60%). *L. garvieae* isolates possessed *Hly1* (40%), *Hly2* (60%), *Hly3* (60%), *NADH oxidase* (70%) and *Eno* (50%). The isolates of *S. dysgalactiae* possessed *Mig* (33%), *brpA* (55%), *Lmb* (77%), *scpB* (33%) and *Rip* (44%). The histopathological examination revealed that *S. agalactiae* and *L. garvieae* cause meningitis in tilapia. Ultimately, isolates showed variable antibiotic resistance profile against the majority of tested antibiotics.

Key words

Farmed tilapia, Pathogenicity, Summer mortality, Virulence profiles.

Dedication

*I dedicate this study
to WHOM I LOVE My 4
Ms, My husband,
FATHER, MOTHER,
AND ALL MY FAMILY*

*for their
understanding, support and
help to succeed.*

*Thank you for every
unconditional
love and guidance.*

ACKNOWLEDGEMENTS

First of all, I wish to express my sincere gratitude to Allah who gives me life, Islam, and all things that make me able to finish this work,

*I would like to express my sincere thanks and deep gratitude to Professor **Dr. Mohamed Sayed Mohamed Marzouk**, Prof. of Fish Disease and Management, Faculty of Veterinary Medicine, Cairo University, for his planning and stimulating supervision, great help, valuable advice, moral support during the course of this thesis and with his aid this work was accomplished. No suitable words can express my deepest gratitude to him.*

*Sincere thanks and deep gratitude are particular to Prof, **Dr. Nermeen Mostafa Mohamed** Prof. of Aquatic Animal Medicine and Management, Faculty of Veterinary Medicine, Cairo University, for her valuable help and encouragement given to me during this work and her unfailing interest, stimulating supervision and willing efforts to facilitate the difficulties during this work,*

*I wish to record my gratitude to **Dr. Nehal Abouelkaramat Younis** Ass. Prof. of Aquatic Animal Medicine and Management, Faculty of Veterinary Medicine, Cairo University, for her tremendous support and encouragement and valuable support.*

*I am also particularly grateful and deeply thankful to prof. **Dr. Hossam Hassan Abbas** Prof. of Hydrobiology, National Research Centre for his supervising, stimulating discussion, sincere help and kind guidance.*

*I offer my great appreciation to prof. Dr. **Waleed Salah El-Din**, Prof. of fish diseases in National Research Centre, Hydrobiology Department, for his supervision, guidance and help during the course of the investigation.*

*I offer my great appreciation to Dr. **Mamdouh Yousef Elgendy**, Assist. Prof. of fish diseases in National Research Centre, Hydrobiology Department, for his supervision, guidance and help in writing my thesis.*

*Also, I wish to express my deep appreciation to Dr. **Mohamed Omar fares**, Assist. Researcher of Fish diseases, Hydrobiology Department, National Research Centre for her valuable support in this study as well as his beneficial advices.*

*Also, I wish to express my deep appreciation to prof. Dr. **El Khatib Yousry Gaafar** Prof. of Fish Pathology, Hydrobiology Department, National Research Centre for his valuable support and help in the pathological work in this study as well as his beneficial advices.*

*I would like to express my grateful thanks to all **staff members, colleagues and technicians** in Department of hydrobiology, National Research Center and Aquatic Animal Medicine and Management department, Faculty of Veterinary Medicine, Cairo University for their continuous encouragement throughout the study.*

Fig. (8)	Photomicrographs showing the histopathological alterations noticed in experimentally infected <i>O. niloticus</i> : A) Brain showing severe hemorrhages and infiltrations of leucocytes; B) spleen showing melanomacrophage centers with hemosiderin deposition; C) hepatopancreas showing hemorrhages with vacuolation in cells; D) Kidney showing separation of renal tubular epithelial cells from its basement membrane and necrotic changes in the interstitial tissue; E) spleen showing white pulp depletion; F) hepatopancreas showing focal area of necrosis and sinusoidal degeneration ;G) spleen showing melanomacrophage centers with necrotic focal areas and some oedema ; H) liver showing congestion, vacuolar degeneration with miss shaped hepatic cord architecture and mononuclear cells infiltration (H&E, Bar=50µm).	93

Chapter

1

Introduction

INTRODUCTION

Aquaculture produces 52% of fish production used for human consumption (**Abdel-Latif *et al.*, 2020**). There is a significant increase in the total fish production in Africa compared to other continents (**FAO, 2020**). Tilapia is one of the most important farmed fish in the world and comes in the second place after carp (**Naylor *et al.*, 2021**). Egypt is the third country on the list of tilapia production after China and Indonesia (**Jansen *et al.*, 2019**). Tilapia production is expected to achieve 25 billion USD by 2028 (**FAO, 2018**). It is an important source of animal protein especially in developing countries and an income to many penurious families (**Mugwanya *et al.*, 2022**). There are many characters in tilapia making it appropriate for farming as it can tolerate a wide range of environmental conditions, its resistance to stress and diseases, and short production cycle. It accepts the artificial feed, as well as it can reproduce in captivity (**Ansah *et al.*, 2014**). Recently, diseases incidence has been increased in tilapia farms (**Dawood, 2021**).

During the last seven years in Egypt there were many episodes of colossal mortalities in tilapia farms relevant to microbial agents. The main causative agents were not clearly identified. Many factors affect these mortalities as deterioration of water quality parameters (**Abu-Elala *et al.*, 2020**). Previous studies reported tilapia lake virus, which is a single stranded RNA virus belongs to *Amnoonviridae* family *Tilapinevirus* genus, in Egypt (**Bacharach *et al.*, 2016**; **Fathi *et al.*,**
