Acknowledgement

First and foremost, I would like to thank **Allah** for giving me the opportunity and the strength to accomplish this work.

I would like to express my deep gratitude to my supervisors **Prof Dr. M. F. El-Shahat**, Prof. of Inorganic & Analytical Chemistry, Faculty of Science, Ain Shams University and **Prof Dr. Taha Mattar**, Rector of Tabbin Institute for Metallurgical Studies (TIMS) and Professor at Central Metallurgical Research & Development Institute (CMRDI). They are always kind enough to suggest the topics of research and to follow up the progress of the work with keen interest and guidance and valuable criticism. Also, I am deeply indebted to **Dr. Moustafa Sanad**, Assoc. Prof. at Chemical and Electrochemical-Processing Department, **(CMRDI)** for his valuable assistance, guidance and continuous help during the progress of the work. I am deeply indebted to, **Prof Dr. Said Obbade**, Institut polytechnique de Grenoble, Laboratoire d'Electrochimie et de physico-chimie des matériaux et des Interfaces **(LEPMI)**, **Grenoble INP – Phelma**, Grenoble, France for his guidance and helpful supervision. Great thank to **Cecile Rossignol** and **Laurent Dessemond** for their help during experimental work and useful discussion about results. Special thanks to **French Embassy at Egypt** and **Agency Universitaire de la Francophonie (AUF)** for the **doctoral fellowship** that helped me to finish the experimental part efficiently. Great thanks to **French Institute at Egypt (IFE)** and Campus France at Lyon, France for facilitating my residency in France for more than one year and guiding me patiently.

Abstract

Protective coatings are used on ferritic stainless-steel interconnects to prevent the transport of the harmful $\text{CrO}_3(\text{g})$ and $\text{CrO}_2(\text{OH})_2(\text{g})$ compounds in solid oxide fuel cells. As these compounds pass along the triple-phase boundary of the cathode, they electrically reduce back to Cr_2O_3 , causing degradation of the cell. The most promising material for protecting the cells is $(\text{Mn},\text{Co})_3\text{O}_4$. Nevertheless, to provide good protection over a long period of time (5 years or more), these coatings should possess a dense microstructure, excellent adhesive properties, excellent electrical conductivity, and good thermal and chemical stability when exposed to an oxidizing atmosphere at high temperatures. Wet ceramic processes and thin film processes have both been studied as deposition techniques. It has been demonstrated, however, that the coatings produced by these methods do not have sufficient density, making their long-term protection questionable.

The main objective of this study is to develop, protective spinel coatings by convenient and economical screen printing (SP) technique. The target is to obtain a dense microstructure, high conductive and low resistance coating. For fulfillment of ideal coating, investigation of the coating layer composition and evaluation of pure $(\text{Mn},\text{Co})_3\text{O}_4$ and doped $(\text{Mn},\text{Co},\text{M})_3\text{O}_4$ ($\text{M}=\text{Cu}$, Fe , Ni , Na and Mg). Since (SP) process has no enough study for preparing such kind of spinel material coating, substitution by

transition and alkali metal effect was deeply studied parallel to optimization of screen-printing process to build-up mechanism for a well-designed coating. The synthesized spinel powder materials before and after coating process were investigated in order to obtain more detailed information about microstructure, thermal stability, electrochemical properties. Consequently, spinel powders and coatings sinter at high temperatures due to their metastable phase structure and small particle and crystallite sizes. The coatings had an excellent Cr barrier and electrical properties, despite being exposed to a harsh environment, due to their dense microstructure and fully recovered spinel phases. As protective coatings for metallic interconnects, $\text{Mn}_{1.5}\text{Co}_{1.5}\text{O}_4$ doped spinel coatings are ideal candidates for screen printing.
