بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

# قَالَ

سَبِّحْ اِنَّكَ لَا تَعْلَمُ لَنَا  
اِلَّا مَا عَلَّمْتَنَا اِنَّكَ اَنْتَ  
الْعَلِيمُ الْعَظِيمُ

صدق الله العظيم

سورة البقرة الآية: ٣٢

# Acknowledgment

*First and foremost, I feel always indebted to **ALLAH**,  
the Most Kind and Most Merciful.*

*I wish to express my gratitude and appreciation to **Prof. Dr. Nevine El-Nahas**, Professor of Neurology Faculty of Medicine-Ain Shams University for her important supervision and precious instructions.*

*Special thanks to **Assist. Prof. Dr. Weam Mohamed Ahmed Ebeid**, Assistant Professor of Ophthalmology and Ophthalmic surgery, Faculty of Medicine, Ain-Shams University for her honest efforts and constant encouragement.*

*I am deeply thankful to **Assist. Prof. Dr. Mona Mokhtar**, Assistant Professor of Neurology Faculty of Medicine-Ain Shams University, **Assist. Prof. Dr. Tamer Roshdy**, Assistant Professor of Neurology Faculty of Medicine-Ain Shams University and **Assist. Prof. Dr. Hossam Shokri**, Assistant Professor of Neurology Faculty of Medicine-Ain Shams University for their great guidance and generous help.*

*It is right to be very grateful to **Assist. Prof. Dr. Mona Kamal Abdellatif**, Assistant Professor of Ophthalmology and Ophthalmic Surgery, Faculty of Medicine, Ain-Shams University for her great efforts.*

*Finally I cannot forget my respectable parents. Soul of **My Father, My Great & Lovely Mother and My Young Brother and Sister** in this dedication. simply they gave me golden opportunity to do this thesis by their unlimited support.*

**Sara Mohammad**

## INTRODUCTION

Cerebral small vessel disease (CSVD) refers to all pathological changes affecting the small vasculature of the brain including; small perforating arterioles, capillaries and venules (*Zhang et al., 2020*).

Vascular risk factors that are commonly found in large vessel disease have shown to contribute to CSVD, as well, including hypertension, diabetes mellitus, smoking and dyslipidemia. Also old age is considered to be a risk factor as the prevalence of CSVD increases with age (*Cannistraro et al., 2019*).

Cerebral amyloid angiopathy is one of the suggested underlying pathologies in some cases of CSVD (*Zoppo et al., 2014*).

Clinically, CSVD accounts for 25% of ischemic strokes and 50% of dementias (*Zhang et al., 2020*).

It may present as acute events (focal neurological deficit) known as lacunar syndrome or chronic events as mild cognitive dysfunction, dementia, mood disorders, gait disturbance, sleep disorder and urinary incontinence. Also, it may be a symptomatic (*Chen et al., 2019*).

Although CSVD is a common reason for strokes and vascular dementia, pathogenesis is still poorly understood. It is suggested that the endothelial dysfunction in cerebral

microvessels may be a key problem. Endothelial failure leads to increased permeability and increased leakage into the vessel wall and the surrounding tissue, damaging of the vessel wall, inflammation, demyelination, glial scar formation, thickening and stiffness of vessels leading to failure of autoregulation, narrowing of the lumen and occlusion, causing featured focal ischemic lesions in the brain parenchyma (*Wardlaw et al., 2013*).

Neuroimaging markers seen on MRI are classified into: Recent small subcortical infarct (DWI), Lacune of presumed vascular origin (FLAIR), White matter hyperintensity of presumed vascular origin (FLAIR), Perivascular space (T1, T2), cerebral microbleed (T2\*-weighted GRE/SWI) (*Chen et al., 2019*).

The changes in brain microvasculature are difficult to be visualized in vivo. Because of similarities between brain and retina in anatomy, embryology and physiology, investigating the retinal vessels network may reflect the brain condition (*Lee et al., 2020*).

Optical coherence tomography angiography (OCTA) is a novel, real-time and noninvasive technique to detect retinal and choroidal blood flow in vivo (*Tsokolas et al., 2020*).

The retinal capillary network is arranged anatomically into several layers as which are: 3 macular plexuses, 4 plexuses in peripapillary region and one capillary layer in midequatorial

and anterior zones where the retina is thinner. OCTA devices are based on (en face) approach to get information of the superficial and deep plexuses. 4 en face zones are detected: superficial plexus in ganglion cell layer, deep plexus, photoreceptors(outer retina) and choriocapillaris. For each en face zone, the indices of perfusion could be reached (*Sambhav, 2017*).

OCTA has a big advantage over classic methods as retinal microvasculature is segmented into layers and can be visualized and quantified more accurately. It is a safe and rapid technique giving a vascular map of retinal blood flow without using intravenous dye (*Tsokolas et al., 2020*).

## AIM OF THE WORK

The aim of our study is to: - detect changes in retinal structure and microvasculature in patients with cerebral small vessel disease using optical coherence tomography angiography, correlate these changes with brain imaging markers and determine if (OCTA) can be used as a screening tool for cerebral small vessel disease.

## Chapter 1

# CEREBRAL SMALL VESSEL DISEASE

### Anatomy of cerebral micro vessel circulation:

**T**he brain is a highly perfused organ consumes about 20% of cardiac output (*Xing et al., 2017*).

The arterial system of the brain forms anastomotic ring at the base of the skull called (circle of Willis) which gives rise to 3 main cerebral arteries (anterior, middle and posterior) divide progressively into small arteries and arterioles that penetrate the brain tissue to supply the subcortical parenchyma called (perforating arteries) one of the components of cerebral small vessels. The second component is the leptomeninges vasoganglion derived from covering of the subarachnoid space and the brain convex surface. The cerebral small vessels include small arteries, arterioles, venules and capillaries at size of 50-400 micrometer (*Qian Li et al., 2018*).

Perivascular spaces (Virchow-Robin spaces) are fluid-filled compartments surrounding the small perforating brain microvessels, act as channels for fluid transport, exchange between cerebro spinal fluid (CSF) and interstitial fluid (ISF) clears waste product from the brain (*Ballerini et al., 2020*).

## **Pathophysiology of CSVD:**

The pathophysiologic aspects of CSVD are still not clear, but some mechanisms are suggested. The core mechanism of CSVD-related brain injury is ischemia, acting through arteriolar narrowing or occlusion lead to hypoperfusion as (vasospasm, hypotension or impaired autoregulation). The another key problem is diffuse cerebrovascular endothelial failure as endothelial failure leads to increased permeability and increased leakage into the vessel wall and the surrounding tissue, damaging of the vessel wall, inflammation, demyelination, glial scar formation, thickening and stiffness of vessels leading to failure of autoregulation, narrowing of the lumen and occlusion, causing featured focal ischemic lesions in the brain parenchyma (*Wardlaw et al., 2013*).
