Essay

*Submitted in Partial Fulfillment for
M.Sc. Degree in Orthopaedic Surgery*

Presented By

WALIED MOHAMED FATHY MAHMOUD
(MB. B.ch)

Supervisors

PROF. DR. MOHAMED OSAMA HEGAZY

*Prof. of Orthopaedic Surgery
Chairmen of Orthopaedics Department
Benha Faculty of Medicine
Zagazig University*

PROF. DR. MOHSEN AHMED MASHHOUR

*Prof. of Orthopaedic Surgery
Benha Faculty of Medicine
Zagazig University*

ASS. PROF. DR. SAMIR MOHAMED ZAHID

*Assist. Prof. of Orthopaedic Surgery
Benha Faculty of Medicine
Zagazig University*

**BENHA FACULTY OF MEDICINE
ZAGAZIG UNIVERSITY**

2002

البقرة ٢٢

ACKNOWLEDGEMENT

First and foremost my deep thanks to Allah. The Most Kind and the Most Merciful.

All my sincere and deepest thanks and gratitude goes to **Professor Dr. MOHAMED OSAMA HEGAZY**, Professor and Chairman of Orthopaedics Department, Benha Faculty of Medicine, Who supervise this work with continuous help and guidance, which together enable me to accomplish this work.

It is great pleasure to acknowledge my deepest gratitude to **Professor Dr. MOHSEN AHMED MASHHOUR**, Professor of Orthopaedics, Benha Faculty of Medicine, for his kind supervision, great assistance and his continuous encouragement, his favors will never be forgotten.

I'm deeply grateful to **Dr. SAMIR MOHAMED ZAHID**, Assistant Professor of Orthopaedics, Benha Faculty of Medicine, for his kind supervision helpful directions through this work.

I am very grateful to **Professor Dr. NAGIB BASHA** Professor of orthopaedics. Cairo University and many thanks to **Professor Dr. EMAD ESSMAT** Professor of orthopaedic, Benha University.

I want to thank **Professor Dr. MOHAMED SALAH SHAWKY** Professor of orthopaedics Benha Faculty of Medicine for his continuous help and supplementation of knowledge and valuable informations about this subject.

Lastly I would like to thank all the **Senior Members and my colleagues of the Orthopaedics department** at Benha Faculty of Medicine for their assistance and encouragement and appreciated advice.

TO MY FAMILY

INDEX

Introduction	1
Composition and anatomy.	3
Zones of organization.	8
Biomechanical implications.	11
Healing of injured tissue.	12
Limitations of healing in cartilage.	14
Factors modulating cartilage healing .	15
Types of traumatic cartilage injuries.	16
Methods of repair.	18
- Natural history or no treatment.	20
- Shaving or debridment of damaged articular cartilage.	21
- Perforation of the subchondral plate.	22
- Changing load on articular surface (osteotomy).	23
- Tissue transplantation :	24
• Alograft versus autograft.	25
• Osteochondral allograft.	29
• Osteochondral autograft.	30
• Perichondrial grafts.	33
• Periosteal grafts.	34
• Mesenchymal stem cells transplantation.	35
• Synthetic and biological matrices.	37
• Pharmacologic modulation.	41
• Chondrocytes transfer.	42
Ex vivo synthesis of chondrogenesis	50
- Definition.	51
- Different approaches used to engineer cartilage ex-vivo.	51
I-Static cultures.	51
II-Articular cartilage genesis with in vehicles of collagen.	53
III-Agarose.	54

IV-Bioreactors.	55
V-Cartilage genesis under microgravity condition.	57
- Critical conditions for tissue engineering at articular cartilage ex-vivo.	58
I- Mechanical loading.	58
II- Seeding density.	61
III- Media composition.	62
IV- Scaffolds.	63
V- Surface modification of scaffolds.	65
Future directions.	66
I -Identification of appropriate cell types.	66
II -Optimization of the use of growth factors.	67
III -Bioreactors the mechanical environment.	68
IV-Improvement of surfaces.	69
- Duration.	71
- Design of cartilage specific scaffolds.	72
- Development of assessment standards.	74

LIST OF ABBREVIATIONS

ACL	: Anterior cruciate ligament.
BMP	: Bone morphogenic protein.
CCA	: Comprehensive cell adhesion.
CS	: Chondroitin sulfate.
DMEM	: Dulbecco's modified Eagle medium.
DMSO	: Dimethyl sulfoxide.
ECM	: Extracellular matrix.
GAG	: Glucosaminoglycan.
KS	: Keratin sulfate.
MSCs	: Mesenchymal stem cells.
Osm	: Osmolality.
PGA	: Polyglycolic acid.
PLA	: Polylactic acid.
RH	: Recombinant human.
TGF- β	: Tissue growth factor Beta.

INTRODUCTION

INTRODUCTION

Articular cartilage is a truly extraordinary tissue seemingly inert and homogeneous. It can tolerate huge amount of intensive and repetitive physical stress and frequently lasts a lifetime.

The function of articular cartilage within synovial joints is to enable smooth, pain free gliding of joints during skeletal motion. Articular cartilage is a hypocellular, avascular and alymphatic tissue with dense collagen and proteoglycan matrix that provides a low-friction, wear-resistant surface (*Couëts et al., 1997*).

This articular cartilage endures extreme levels of mechanical stress over many decades and is a constant flux of skeletal morphogenesis, development and growth such that the anabolic and catabolic activities of the cartilage are balanced.

However, it can be damaged by a variety of mechanical, chemical and microbiological agents often with disabling symptoms of arthritis as the end result of the process. Which leads to irreversible damage.

As early as (1743). *Hunter* observed that (cartilage once destroyed, never heals) this concept has remained essentially unchanged for most of the intervening two and half centuries, and has been reinforced by numerous studies documenting the abortive and fruitless response of chondrocytes to injuries. This is because of the avascular nature of the articular cartilage and the fact that chondrocytes are trapped within their matrix and have low mitotic activity.
