# **Experimental Study of Wave Overtopping on Seawalls**

A Thesis submitted in partial fulfillment of the requirements of the degree  
of Master of Science in Civil Engineering  
Irrigation & Hydraulics [2020]

Submitted By

**Eng. Mohamed Abdelmoaty Salah Abdelmoaty**

B.Sc. Civil Engineering –Irrigation &Hydraulics [2014]  
Demonstrator in the Irrigation &Hydraulics Department  
Faculty of Engineering- Ain Shams University

Supervised by

**Prof. Dr. Yasser ElSayed Ibrahim Mostafa**

Professor of Harbors Engineering and Marine Structures  
Irrigation and Hydraulics Department  
Faculty of Engineering Ain-Shams University

**Dr. Ahmed Mohamed Balah**

Lecturer at Irrigation and Hydraulics Department  
Faculty of Engineering Ain-Shams University

**Cairo – Egypt  
January 2020**

## **TITLE SHEET**

**Name:** Mohamed Abdelmoaty Salah Abdelmoaty

**Degree:** Master Degree

**Department:** Irrigation and Hydraulics

**Faculty:** Engineering

**University:** Ain Shams

**Graduation Year:** 2014

**Degree Granting Year:** 2020

## Researcher data

<b>Name:</b>	Mohamed Abdelmoaty Salah Abdelmoaty
<b>Date of birth:</b>	June - 01 - 1992
<b>Place of birth:</b>	Cairo, Egypt.
<b>Scientific Degrees:</b>	B.Sc. Civil Engineering – Irrigation & Hydraulics, June - 2014
<b>Present position:</b>	Demonstrator, Irrigation & Hydraulics Department Faculty of Engineering - Ain Shams University

## **Statement**

This thesis is submitted to the Irrigation and Hydraulics Department, Faculty of Engineering, Ain Shams University in the partial fulfillment of the requirements for the Degree of Master in Civil Engineering.

The work in this thesis was carried out in the hydraulic laboratory of Irrigation and Hydraulics Department, Faculty of Engineering, Ain Shams University from September 2016 to September 2019.

No part of this thesis has been submitted for a degree or a qualification at any other university or institution.

**Date:**

**Signature:**

**Name:** Mohamed Abdelmoaty Salah Abdelmoaty

## Acknowledgement

This thesis is the result of three years of work during which many people have given me help and support. I would like to offer them my gratitude.

I would like to express my deepest gratitude to **Prof. Dr. Yasser ElSayed Mostafa** Professor of Harbors Engineering and Marine Structures Irrigation and Hydraulics Department Faculty of Engineering Ain-Shams University, for his continuous guidance, expert advice and valuable suggestions that greatly enriched this work.

I am deeply grateful to the kindness of **Dr. Ahmed Mohamed Balah**, Irrigation and Hydraulics Department, Faculty of Engineering, Ain Shams University, for his continuous support and sincere contributions to this work. this thesis would not have been possible without the guidance and the help from my supervisor,

Finally, I am forever indebted to my parents, my wife for their understanding, endless patience and encouragement when it was most required. I also gratefully acknowledge the financial assistance they rendered, many thanks to all my colleagues in the Department of Irrigation and Hydraulics for their sincere encouragement.

## Abstract

Wave overtopping is a key process in coastal environment. The assessment of the wave overtopping rates is an important aspect in the design of different coastal structures, such as seawalls. It was found that increasing the roughness of the seawall slope has significant impact on reducing the wave overtopping rates due to its energy dissipation effect. This study presents the study of modeling wave overtopping using experimentally to investigate the effect of energy dissipators on reducing wave overtopping discharge for sloped seawall 2H:1V with an inherent or artificially added degree of roughness. Experimental tests were conducted in the wave flume at the Hydraulic laboratory of Irrigation and Hydraulics Department, Faculty of Engineering, Ain Shams University. Different models were tested under various wave and water depth conditions to examine the efficiency of the two types of energy dissipation measures (submerged breakwater & two-layers of riprap); increasing the roughness of the seawall slope and construct a submerged breakwater in front of the wall. Only non-breaking waves are investigated. The tested models include a smooth seawall, a smooth seawall with submerged breakwater in front of it at variable distance and a rough seawall with two-layers of riprap and varying the stones height. The impact of the proposed energy dissipation measures was quantified by comparing the obtained results to known wave overtopping estimation formulae in literature where no such measures were adopted and accordingly the reduction factors for these measures were deduced.

*Keywords: seawalls, wave overtopping, wave energy dissipation, experimental modelling.*
