EFFECT OF SYNTHETIC PYRETHROIDS ON RAT IMMUNE SYSTEM

A Thesis

**Presented to the Graduate School
Faculty of Science, Alexandria University
in Partial Fulfillment of the Requirements**

for the

Master Degree

in

Biochemistry

by

SALWA MOUSTAFA AHMAD ABD-ALLAH
B. Sc. (1990)

Supervised by

Prof. Dr. Kamal M. Kandeel
*Chairman of Biochemistry Department
Prof. of Biochemistry
Faculty of Science
Alexandria University*

Prof. Dr. Nabil A. Mansour
*Prof. of Pesticide Chemistry
Pesticide Chemistry Department
Faculty of Agriculture
Alexandria University*

*Dr. Ahmad R. Bassiouny
Lecturer of Biochemistry
Biochemistry Department
Faculty of Science
Alexandria University*

June, 1995

ACKNOWLEDGEMENT

First, all thanks are due to Allah, the most gracious, the most merciful.

My thanks to my mother, father and brothers for their continuous support to me.

I am so grateful to Professor Dr. Nabil A. Mansour; Professor of Pesticide Chemistry and Toxicology, Faculty of Agriculture, University of Alexandria, Alexandria, Egypt, for his supervision, planning and encouragement throughout the course of this study and giving me the chance to carry out my research in his laboratory. Particular thanks to Dr. Fikry El-Shahawi for his continuous assistance and the time he generously spent with me in all stages of the work.

Thanks are most sincerely due to Professor Dr. Kamal M. Kandeel; Professor of Biochemistry, Faculty of Science, University of Alexandria, Alexandria, Egypt, for his enthusiasm and help during this study.

I am very thankful to Dr. Ahmad R. Bassiouny; Lecturer of Biochemistry, Faculty of Science, University of Alexandria, Alexandria, Egypt, for his supervision and efforts he paid for improvement of this work.

Great thanks are indebted to Dr. El-Layel El-Agami, associate professor of immunochemistry, Department of Dairy Science, Faculty of Agriculture, University of Alexandria, Alexandria, Egypt, for providing helpful guidance and also his suggestion during the preparation of the manuscript.

I would like to thank all members of the toxicology laboratory at the Department of Pesticide Chemistry, Faculty of Agriculture for the help they have given to me throughout my work, particular thank to Professor Dr. Mahmoud Morshedy for his nice help and useful criticism during this work.

TABLE OF CONTENTS

	Page
I. INTRODUCTION	
A. An overview on the history of pyrethroids	1
B. Pyrethroids : Environmental impact and occupational risk.....	6
C. Molecular basis of pyrethroid action	
1. Neurobehavioural toxicity - and triggering mechanisms.....	16
2. Characterization of neurotransmitter receptors.....	21
3. Ion channels - and Ca^{2+} homeostasis.....	27
4. Membrane toxicity.....	30
5. Miscellaneous effects.....	34
D. Potential role for immunologic involvement.....	
1. General emphasis.....	45
2. Mechanisms of immune alteration.....	47
3. Assessment of immunotoxicity in rodents.....	50
4. Pesticides - induced immune dysfunction.....	55
5. Immunotoxic potential of pyrethroids.....	65
6. Genotoxic potential of pyrethroids.....	69
II STATEMENT OF PURPOSE	76
III MATERIALS and METHODS	
A. Animals	
1. Experimental protocol.....	77
2. Bleeding regimen.....	78
3. Immunization schedule.....	78
B. Chemicals, Biochemicals, and Supplies	80
C. Experimental procedures.....	
1. Blood collection.....	83
2. Hematological studies.....	
2.1 Total leucocyte counts.....	83
2.2 Differential formula of leucocytes.....	84
2.3 Total erthrocyte counts.....	84
2.4 Hematocrit value.....	85
3. Analysis of lymphocytes for DNA fragmentation.....	
3.1 Lymphocytes - separation.....	85
3.2 DNA - fragmentation assay.....	86
3.3 DNA - quantitation.....	86
3.4 DNA- electrophoresis.....	87

4. Effect of deltamethrin on erythrocyte membrane $\text{Ca}^{2+}\text{Mg}^{2+}\text{ATPase}$	
4.1 Preparation of erythrocyte membranes	88
4.2 $\text{Ca}^{2+}\text{Mg}^{2+}\text{ATPase}$ assay.....	87
4.3 Membrane protein assay.....	89
5. Purification and characterization procedures for rat myeloperoxidase.....	
5.1 PMN - Suspension preparation.....	89
5.2 Extraction of rat myeloperoxidase.....	90
5.3 Enzyme - assay	91
6. Biochemical studies.....	
6.1 Serum preparation.....	92
6.2 Lactate - dehydrogenase (LDH) assay.....	92
6.3 Serum protein analysis.....	
6.3.1 Determination of total protein	93
6.3.2 Electrophoretic - technique(SDS - PAGE).....	
6.3.2.1 Preparation of stock solutions.....	93
6.3.2.2 Preparation of slab gels.....	94
6.3.2.3 Preparation of samples.....	94
6.3.2.4 Loading of samples and electrophoresis.....	95
6.3.2.5. Staining and destaining of the gel.....	
Commassie blue - technique	95
6.3.3 Determination of α globulin level.....	95
7. Immunoglobulin quantitation.....	
7.1 Total IgG level.....	96
7.2 IgG- subclass expression.....	96
8. Bone - marrow cellularity test.....	97
8.1 Isolation of bone marrow.....	97
8.2 Microscopic - examination.....	98
D. Statistical analyses.....	98
IV RESULTS.....	99
A. Clinical observations.....	
1. Signs of toxicity.....	99
2. Variations in total body weight.....	100
3. Survival rate determination.....	103
B. Hematologic profile in deltamethrin- treated rats.....	105
C. Induction of fragmentation of lymphocyte - DNA in vivo : electrophoretic analysis.....	112
D. Inhibitory effect of deltamethrin on erythrocyte membrane	

Ca ²⁺ - Mg ²⁺ ATPase.....	118
E. Characteristion and assessment of phagocytic leucocyte myeloperoxidase activity.....	121
F. Biochemical determinations	125
1. The effect of deltamethrin on LDH activity.....	
2. Estimation of serum total protein.....	
3. Electrophoretic analysis of serum proteins : α globulin quantitation.	
G. Evaluation of humoral immunity : IgG - quantitation.....	135
H. Effect of deltamethrin on the differentiation of bone marrow.....	138
V. DISCUSSION.....	144
VI SUMMARY AND CONCLUSION.....	174
VII REFERENCES.....	177
VII ARABIC SUMMARY	

INTRODUCTION

I. INTRODUCTION

An over view on the history of pyrethroids:

The term "pesticide" is a general classification that includes a variety of chemicals with different uses. Pesticidal chemicals have in common the capability of destroying life of some form and are classified as pesticides because the organisms against which they are directed are deemed to be undesirable by the person or society that applies them. Indeed, insecticides represent one group of pesticides that are used in large quantities and have a history beginning before the mid- 1940s where the primary pesticides in use were botanical in origin and compounds of heavy metals. Subsequently, there has been a marked increase in total pesticide usage and a rapid proliferation of synthetic organic compounds; hence, in the beginnings of 1940s, halogenated aromatic hydrocarbons (HAHs), a class of widely disseminated compounds consisting of fused benzene rings sharing an anthracene nucleus; were introduced. HAHs are by- products during the manufacture of halogenated biphenyls or phenols and produced at commercial incinerators. These compounds include specific chlorinated dibenzo-p-dioxins, dibenzofurans, hexachlorobenzene, polychlorinated biphenyls (PCBs) and polybrominated biphenyls^(1,2).

Following reports of animal and human toxicity, the production of HAHs was suspended, because they are inert and resistant to environmental degradation and thus tend to accumulate in the environment. Human exposure occurs via inhalation or ingestion . The high lipid solubility of these compounds allows them to accumulate up the food chain⁽³⁾. Additionally, selected isomers of this class of compounds have been associated with teratogenic, carcinogenic, neurotoxic and hepatotoxic effects⁽⁴⁾.

In the mid- 1950s there was a shift in the types of insecticides used, from the organochlorine to the less stable organophosphate and carbamate classes. Shifts in uses of major classes reflect not only developments in agricultural practice but also the effect of regulatory restrictions and the development of resistance by pests to certain class of chemicals.

Organophosphoric compounds are considered to be nerve agents of high toxicity, used intensively during the 2nd world war as chemical weapons. This class of pentavalent phosphoric compounds include phosphostigmines, diisopropyl fluorophosphonate (DFP), ethylpyrophosphate, malation, parathion and other analogues. The cumulative, widespread and long acting effects of organo-phosphates make them unsuitable for usage due to their high acute toxicity when ingested, inhaled or absorbed through intact skin. Being lipid-soluble, they readily penetrate the blood brain barrier and can exert serious toxic effects in the central nervous system.

Similar to the organophosphates, carbamate esters and methyl carbamate insecticides were discovered as anticholinesterases and also considered to be very hazardous. Poisoning produced from carbamate insecticides is clinically similar to that produced by organophosphates. Carbaryl is the common representative of the N-methyl carbamates used for insecticidal application⁽⁵⁾. The problem of cross resistance resulted in expiration of the potential of many of these new compounds and thus limited its application period. However, the build up of resistance and the high persistence of all these insecticides opened the way for introduction and large scale development of natural and synthetic pyrethroids.

Pyrethroid insecticides are neurotoxins that have achieved widespread agricultural and environmental health applications, due to their strongly insecticidal properties. The pyrethroids are derivatives of natural pyrethrins^(6,7).
