Canal Shaping Ability And Wear Resistance

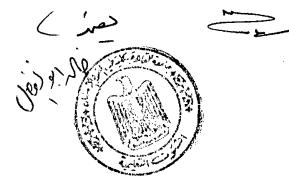

Of NiTi LightSpeed Instruments:

Effect Of Rotational Speed.

(An invitro study)

/1/2×2.5

A thesis submitted to the Faculty of Oral and Dental Medicine, Cairo University, in partial fulfillment of requirements of the Master of Dental Science (Endodontics).

Presented by:

Reham Mohammad Said Abdullah Siam.

B.D.S. (Cairo University).

Department of Endodontics

Faculty of Oral and Dental Medicine

Cairo University

B ,77. هرسم الله الرحمن الرحيم

Supervisors

Prof. Dr. Madiha M. Gomaa Professor of Endodontics Faculty of Oral and Dental Medicine Cairo University

Prof. Dr. Inas S.A. Sami
Professor of Dental Biomaterials
Faculty of Oral and Dental Medicine
Cairo University

Acknowledgement

Praise to Allah, the Most Gracious and the Most Merciful who guides us to the right way.

I would like to express my sincere gratitude and deep appreciation to Prof. Dr. Madiha M. Gomaa, Professor of Endodontics, Faculty of Oral and Dental Medicine, Cairo University for her patience, kindness and unlimited support. It was a great honor to work under her meticulous supervision.

I acknowledge with gratitude and love Prof.Dr. Inas S.A. Sami, Professor of Dental Biomaterials, Faculty of Oral and Dental Medicine, Cairo University, for her guidance and support.

Special thanks are due to Dr. Inas El Attar for her generous help with the achievement of the statistical aspect of this study.

Thanks are also due to engineer Saleh Attia at the AUC for his help in designing and constructing the metal muffle used in this study.

Endless thanks to all my professors, staff members and colleagues in the Endodontic department for their friendly support and concern.

Very special thanks to my beloved little sister Menna for her generous help in the computer work for this thesis and endless patience and support.

Finally, I would like to thank my family, especially my mother, for their prayers, love and support, and to all who helped me throughout this work.

LIST OF TABLES

Table	page
(1): Criteria for testing wear qualitatively.	52
(2): Mean area and standard deviation after canal preparation	
at 750 and 2000 r.p.m.	55
(3): Mean and standard deviation of the length of canal center	·
displacement at the two specified speeds (750 and 2000 r.p.n	n.)
at the three section levels (2mm, 4mm, and 6mm)	55
(4): Criteria of instruments' wear detected in the unused	
state, after preparation of 5 canals, and after preparation of	
9 canals.	61

I-Introduction

I-Introduction

Biomechanical preparation is the most important factor in the success of endodontic treatment. Instrumentation objectives include debriding the root canal system, maintaining the apical foramen in its original position, keeping the apical foramen as small as practical and developing a continuously tapering conical form as stated by Schilder.

These objectives are easily achieved in straight root canals with the traditional stainless steel files. However, they have shown to create aberrations in the root canals due to canal morphology (curvature) and instrument limitation (stiffness and design).

There is a degree of canal curvature present in most of the teeth of the human dentition. The stiffness of the instrument and its design tend to straighten these curved canals. It also may lead to difficulty in debridement, ledge, transportation of apical foramen, root perforation, apical zipping and strip perforation which in turn may lead to failure of endodontic therapy.

To reduce these procedural errors, modifications were done in instrumentation technique as well as in instrument design. Some of the instrumentation technique modifications are the step-back, anti-curvature filing, step down and balanced force technique for root canal preparation. Where as in instrument design, modifications were made in cross section and tip configuration. The change in cross section of the instrument was to increase its flexibility and maintain its centrability inside the canal e.g. K-Flex, Uni-file and S-file. Also, the change to a non-cutting pilot tip as Flex-R files was found to reduce the risk of perforation and ledging. However, the use of these modified stainless steel files in curved canals is still risky and
