Insulin-like Growth Factor-1 as a Prognostic Marker in Persistent Diarrhea

Thesis

For Partial Fulfillment of M.D Degree in Pediatrics

By: Dr. Abdulqader Mahmoud Mohammed Althaqaby
MSC Pediatrics

Under Supervision of:

♦ Prof. Dr. Hamed Mahmoud Shatlah
♦ Dean of Faculty of Medicine Ain Shams University

♦ Prof. Dr. Nagia Mostafa Badawy
♦ Prof. of Pediatrics, Ain Shams University

♦ Dr. Ehab Khairy Emam
♦ Lecturer of Pediatrics, Ain Shams University

♦ Dr. Yasser Ahmad Zaitoon
♦ Lecturer of Clinical Pathology, Ain Shams University

Introduction & Aim Of the Work

Persistent diarrhea, defined as diarrhea persisting ≥ 14 days, is recognized as a major cause of morbidity and mortality in childhood, accounting for 3-20% of all childhood diarrheal episodes, with associated case fatality rates exceeding 15%. (Bhutta et al, 1999)

There is considerable interest in the role of growth factors in postnatal intestinal growth and maturation and the regulation of intestinal adaptation to changes in the nutritional status. (Winesett et al, 1995)

Circulating insulin-like growth factor 1 (IGF-1) is produced mainly in the liver in response to growth hormone, but is also produced in most tissues and the distribution of its receptors is widespread. The intestine is considered to be one of the most responsive target organs for IGF-1 and some regard it as essential for intestinal repair. (Ziegler et al, 1996)

Persistent diarrhea is usually associated with nutritional abnormalities and appropriate nutritional rehabilitation is considered an important cornerstone of treatment. (Bhutta et al, 1996)

There are few data on IGF-1 status and its dynamics during recovery from persistent diarrhea. Hence, the aim of this work is to measure IGF-1 level, before and after management and nutritional rehabilitation, in patients with persistent diarrhea of different causes, and evaluate it as a prognostic marker.

Subjects and Methods

An adequate number of patients aged between 6-36 months, with persistent diarrhea, will be involved in this study.

The patients will be selected from the outpatient clinics and from patients admitted in the pediatric hospital of Ain Shams University.

☐ **All patients will be subjected to:**

1. Full history-taking laying stress on dietary history, history suggestive of infection, thorough clinical examination, laying stress on signs of infection, signs of nutritional deficiency and anthropometric.
2. Correction of dehydration or electrolyte disturbances if needed.
3. After stabilization, children will follow a diet based on rice, lentil and yogurt, providing at least 100 kcal/kg/day for 3 days. Then, return to a normal diet. Successful response will be defined as weight gain > 5 gm/kg/day and resolution of diarrhea (< 5 motions/day).
4. stool analysis searching for:
 - ☐ Parasitic infestations.
 - ☐ Pus cells (if positive, stool culture will be done).
 - ☐ Fecal fat.
 - ☐ Fecal alpha 1 anti-trypsin.
5. C-reactive protein (CRP), complete blood count (CBC) and erythrocyte sedimentation rate (ESR) to diagnose infection.
6. **Hydrogen Breath** test for carbohydrates (CHO) mal-absorption.
7. **Dual sugar absorption test** using oral administration of isotonic lactulose and L-rhamnose followed by urine collection for 6 hours at baseline, and repeated on the seventh day to test for intestinal permeability.
8. Measurement of serum **albumin**, **pre-albumin** and **IGF-1** will be done at baseline and repeated at day seven.

ACKNOWLEDGEMENT

I would like to express my deepest thanks and sincere gratitude to **Prof. Dr. Hamid Shatla**, Professor of Pediatrics, Faculty of Medicine, Ain Shams University, for suggesting the subject, kind help and support, continuous encouragement, valuable guidance and grateful supervision and I consider my self very lucky to be under his supervision in master and M.D.

I am also greatly indebted to **Prof. Dr. Nagia Bahgat Badawi**, Professor of Pediatrics, Faculty of Medicine, Ain Shams University, for her enthusiastic encouragement, valuable suggestions and kindness during the preparation of this thesis.

Many thanks are also given to **Dr. Ehab Khayri**, Assistant Professor of Pediatrics, Faculty of Medicine, Ain Shams University, for his valuable effort and constant guidance, enthusiastic encouragement and deep engagement in the sophisticated details of this thesis.

I wish also to express my deep appreciation and indebtedness to **Dr. Yaser Zaytoon**, Assistant Professor of Clinical Pathology, Faculty of Medicine, Ain Shams University, for his generous help, valuable guidance, support and great assistance.

Special words of thanks should be expressed to **Dr. Amira Gamal** Lecturer of Pediatrics, Faculty of Medicine, Ain Shams University, for her kind help, in termination of this thesis.
