STATEMENT

This dissertation is submitted to the faculty of Engineering at Ain Shams University for getting MSc. Degree in Civil Engineering (Structural Department).

The work included in this thesis was carried out by the researcher in the Department of Structural Engineering, Ain Shams University.

No part of this thesis was submitted for a degree or a qualification at any other institution or university.

Name : Mohamed Hossam Badreldin Ibrahim Mansor

Signature:

Date : / /

Researcher Data

Name : Mohamed Hossam Badreldin Ibrahim Mansor

Date of birth : 18/01/1995

Place of birth : Cairo, Egypt

Last academic degree : Bachelor of Science in Civil Engineering

Field of specialization : Structural Engineering

University issued the degree : Faculty of Engineering, Ain Shams University

Date of issued degree : 2017

Current job : Teaching Assistant at Ain Shams University

ACKNOWLEDGEMENTS

First of all, I would like to thank Allah who guided and assisted me to conduct this research.

I would like to extremely express my gratitude and appreciation to Dr. Ihab Mohamed El - Aghoury for his highly appreciated effort and support throughout all phases of the research.

I would like to extremely express my appreciation to Prof. Dr. Sherif Kamal Hassan, and Prof. Dr. Sherif Mohamed Ibrahim who gave me helpful advice and constructive criticism that guided me during my study.

Finally, I would like to give special thanks to my fiancée (Rawan) and my family as a whole for their continuous support during performing my research.

ABSTRACT

Using sigma cold-formed steel sections is continuously increasing in industrial buildings due to their light weight. The sigma sections are characterized by their web stiffeners which increase their buckling strength over the conventional C-section and bring the shear center closer to the C.G of the section. This thesis answered the question of whether using the sigma section, as an alternative to the C-section subjected to bending moment, is feasible or not. A comparison was carried out between the sigma and C sections. The results demonstrated the superiority of the sigma section over the C-section, especially when the web local or distortional buckling is the governing failure mode. In addition, due to the lack of investigations for the behavior of sigma beams, the Direct Strength Method hypothesized that the sigma beam is not a prequalified beam for the Direct Strength Method implementation; consequently, conservative safety factors must be used in the design. In the current study, the behavior of sigma beams is investigated by studying the relation between the nominal flexural capacity (M_n) and critical buckling moment (M_{cr}); therefore, a more economical design can be achieved.

Furthermore, this thesis proposed a simple design approach for designing cold-formed sigma section subjected to bending moment using the Direct Strength Method (DSM). A wide parametric study was carried out using a wide range of dimensional parameters. The proposed equations can calculate the critical local and distortional buckling moments without the need of using specific software that might complicate the design process.

KEYWORDS

Direct Strength Method, Sigma section, ABAQUS, Cold-formed steel sections, CUFSM, Finite strip analysis, Finite element analysis.

EXAMINERS COMMITTEE:	1
STATEMENT	2
ACKNOWLEDGEMENTS	5
ABSTRACT	6
LIST OF CONTENTS	8
LIST OF TABLES	12
LIST OF FIGURES	13
1.1 General	17
1.2 Aim of the research	19
1.3 Outline of the thesis	20
CHAPTER 2	22
2.1 Introduction	22
2.1.1 Flexural or torsional–flexural buckling.....	23
2.1.2 local buckling	24
2.1.3 Distortional buckling.....	24
2.1.4 Prequalified beams in the Direct Strength Method	25
2.2 LITERATURE	27
CHAPTER 3	32
3.1 Introduction	32
3.2 Verification of the Finite Element Model	33
3.2.1 Element Type	33
3.2.2 Loading and Boundary Conditions	34
3.2.3 Material Property	36
3.2.4 Geometric Imperfection	37
3.2.5 Results	39
3.3 Verification of the Finite Strip Model.....	46
3.3.1 Finite Strip Model	46

3.3.2 Finite Element Model.....	47
3.3.3 Finite Strip Verification Results.....	48
CHAPTER 4	50
4.1 Introduction	50
4.2 Comparison Procedures	51
4.3 Results and Discussion.....	53
4.3.1 Signature Curve of Sigma and C-sections that have the Same Thickness.....	54
4.3.2 Signature Curve of Sigma and C-sections that have the Same Weight	56
4.3.3 Local Buckling	59
4.3.4 Distortional Buckling	64
4.3.5 Lateral Torsional Buckling	66
4.3.6 Relation between M_n and M_{cr} of Sigma Section.....	68
4.4 Conclusions	70
CHAPTER 5	72
5.1 Introduction	72
5.2 Beam Specimens	72
5.3 Studied Parameters.....	72
5.4 Finite Strip Analysis.....	73
5.5 Factors Affecting Critical Local Buckling Length.....	75
5.5.1 Flange width (F).....	75
5.5.1.1 Effect of flange width (F) on L_{cr} for specimens with F/D ratio (0.3) and different F/t ratios	75
5.5.1.2 Effect of flange width (F) on L_{cr} for specimens with F/D ratio (0.4) and different F/t ratios	76
5.5.1.3 Effect of flange width (F) on L_{cr} for specimens with F/D ratio (0.5) and different F/t ratios	77
5.5.2 Flange width to thickness ratio (F/t)	78
5.5.2.1 Effect of flange width to thickness ratio (F/t) on L_{cr} for specimens with F/D ratio (0.3) and different web depths (D).....	78
5.5.2.2 Effect of flange width to thickness ratio (F/t) on L_{cr} for specimens with F/D ratio (0.4) and different web depths (D).....	79
5.5.2.3 Effect of flange width to thickness ratio (F/t) on L_{cr} for specimens with F/D ratio (0.5) and different web depths (D).....	80
5.6 Factors Affecting Critical Local Buckling Moment (M_{crl}).....	81
5.6.1 Critical buckling length (L_{cr}).....	81
5.6.1.1 Effect of critical length (L_{cr}) on M_{crl} for specimens with F/D ratio (0.3) and different F/t ratios	81
5.6.1.2 Effect of critical length (L_{cr}) on M_{crl} for specimens with F/D ratio (0.4) and different F/t ratios	82

5.6.1.3 Effect of critical length (L_{cr}) on M_{cr} . for specimens with F/D ratio (0.5) and different F/t ratios	83
5.6.2 Flange width to thickness ratio (F/t)	84
5.6.2.1 Effect of flange width to thickness ratio (F/t) on M_{cr} . for specimens with F/D ratio (0.3) and different web depths (D).....	84
5.6.2.2 Effect of flange width to thickness ratio (F/t) on M_{cr} . for specimens with F/D ratio (0.4) and different web depths (D).....	85
5.6.2.3 Effect of flange width to thickness ratio (F/t) on M_{cr} . for specimens with F/D ratio (0.5) and different web depths (D).....	86
5.7 Outcome	87
5.7.1 Flange width to web depth ratio.....	88
