# **Dyslexia among Arabic Speaking Egyptian Children with Unilateral Cochlear Implant**

*Thesis*

*Submitted for the Partial Fulfilment of the  
requirement of Master Degree in Phoniatics*

*By*

**Shereen Alaa EL-Din Taha Taha**

*M.B., B.Ch. Faculty of Medicine, Zagazig University  
Resident of Phoniatics at Zagazig University Hospitals*

*Supervised by*

**Prof. Dr. Nirvana Gamal EL -Din Hafez**

*Professor of Phoniatics - ENT Department  
Faculty of Medicine, Ain Shams University*

**Prof. Dr. Elham Magdy Hassan**

*Assistant Professor of Phoniatics - ENT Department  
Faculty of Medicine, Zagazig University*

**Dr. / Mariam Salah Shadi**

*Lecturer of Phoniatics - ENT Department  
Faculty of Medicine, Ain Shams University*

*Faculty of Medicine  
Ain Shams University*

*2021*

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

# قَالَ

لَسِبْنَا نِكَ لَا نَعْلَمُ لَنَا  
إِلَّا مَا عَلَّمْتَنَا إِنَّكَ أَنْتَ  
الْعَلِيمُ الْعَظِيمُ

صدقة الله العظيم

سورة البقرة الآية: ٣٢

# Acknowledgment

*First of all, and foremost, all my deepest thanks to **ALLAH**, the most merciful and who is always and forever behind all success.*

*I would like to express my deep and sincere gratitude to **Prof. Dr. Nirvana Gamal EL -Din Hafez**, Professor of Phoniatics, Faculty of Medicine, Ain Shams University, for providing invaluable guidance throughout this research. It was a great privilege and honor to work and study under her guidance and I am extremely grateful for what she has offered me.*

*I am deeply greatly indebted to **Prof. Dr. Elham Magdy Hassan**, Assistant Professor of Phoniatics, Faculty of Medicine, Zagazig University, who devoted time and efforts to this work. I am grateful for her for her valuable advice and for her sincere help and ultimate support.*

*My sincere thanks and appreciation also goes to **Dr. Mariam Salah Shadi**, Lecturer of Phoniatics, Faculty of Medicine, Ain Shams University, for her continuous encouragement and for her kind help and constant support.*

*An endless thanks for **My Family** for their support without it, I would never completed this work.*

*Shereen Alaa El Din Taha*

## INTRODUCTION

Hearing loss affects millions of people around the world and is estimated to be the fourth leading cause of disability globally (*Cunningham and Tucci, 2017*). WHO estimates in 2008 found that 360 million people worldwide live with disabling hearing loss, including 32 million children (*WHO, 2012*). Hearing aids provide benefits for the majority of people with hearing loss, those with more severe hearing loss may benefit more from cochlear implantation (*Barnett et al., 2016*).

Cochlear implants (CIs) have offered restoration of hearing to people with severe to profound hearing loss. Restoration of hearing with CI causes changes in the sound inputs which are processed in the brain, which does not only include the auditory cortex, but also it involves other areas such as visual cortex (*Stropahl et al., 2017*).

Communication skills of children with hearing loss can be improved with the use of cochlear implants. At school, both normal and hearing-impaired children are taught to read and write the same curriculum, but when evaluating the classroom skills of hearing-impaired children, several differences in their reading skills can be found compared to their normal-hearing peers (*Tiryaki, 2014*).

Reading skills are necessary for educational development in normal hearing children, many studies have shown that

children with hearing loss often experience delays in reading (*Rezaei et al., 2016*).

Hearing impaired children follow the same semantic process when acquiring the same group of skills compared with their normal hearing peers when their reading skills are examined. However, as a result of the insufficiency of the sound stimuli reaching the brain during the speech and language development, hearing loss can negatively affect the reading skills of hearing-impaired individuals (*Tiryaki, 2014*).

Reading is the ability to transform written language into spoken information and extract its meaning in an efficient manner (*Horowitz-Kraus et al., 2014*). Reading fluency is defined as the ability to read accurately and quickly (*Katzir et al., 2016*), is based on language, visual processing and higher-level (executive functions). Executive functions are the general core cognitive mechanisms used to adjust and facilitate various cognitive processes, such as planning and organization (*Horowitz-Kraus, 2016*).

The reading process includes corresponding sounds with abstract graphemes (phonological process), identifying the words or word-parts (orthographic process), and extracting the meaning of the information (semantic ability) (*Horowitz-Kraus, 2016*).

In normal hearing children, phonology is very essential for reading acquisition, so we need to know whether phonological processing and representations can develop in deaf children in the absence of an adequate auditory capacity (*Domínguez et al., 2019*). CI has a direct effect on speech perception and on the development of phonological representations of words (*Domínguez et al., 2019*), so we should consider that; phonology is not only auditory, but also audiovisual for hearing and deaf people (*Bayard et al., 2014*). The role of CIs which greatly improve auditory perception is to improve deaf children auditory information that should help in the development of phonological representations of speech and facilitate reading acquisition (*Johnson & Goswami, 2010*).

Another point of view suggests that reading acquisition follows the same path in deaf and hearing children, so there is an important association between phonology and reading, so reading difficulties are considered as phonological deficits in case of both deaf and hearing children (*Bochner & Kelstone, 2016*).

Assessment of reading abilities in cochlear implant children has been an issue to discuss as these children need urgent intervention to help them catch up with their normal peers. CI children are rarely assessed for their reading skills in Egypt, so integration of learning assessment in their general evaluation and during follow up should be considered for early intervention.

## AIM OF THE WORK

This work aims to assess reading abilities in cochlear implant school children in order to highlight their dyslexia profile, and to consider such problems in earlier years of life. This would subsequently improve their expected academic delay.
