**PHENOTYPIC AND GENOTYPIC VARIATION OF
(*SOLANUM TUBEROSUM*, L.) REGENERATED
VIA TISSUE CULTURE**

Presented By

EMAN YOUSSEF MOHAMED HASSAN

Submitted on Partial Fulfillment of the Requirements
for the Degree of

Doctor of Philosophy in Agricultural Sciences
in
(HORTICULTURE)

Examiner's Committee :

Approved

Prof. Dr. HOSSAM EL-DIN MOHAMED FATHY EL-WAKIL
Prof. of Genetics, and Dean of Faculty of Agriculture,
(Saba Basha), Alexandria University.

H.E. EL-WAKIL

Prof. Dr. AHMED YOUSSEF EL-METAINY
Prof. of Genetics, Faculty of Agriculture (El-Shatby),
Alexandria University.

A. El-Metainy

Prof. Dr. ALY IBRAHIM ALY EBIDA
Prof. of Vegetable Crops, Plant Production Department
Fac. of Agric. (Saba Basha), Alexandria University.

Aly Ebida

Prof. Dr. AHMED NABIL FAYAD
Chief Researches, and Head of Potato Research
Department, Horticulture Research Institute,
Agriculture Researches Center.

A. N. FAYAD

SUPERVISOR'S COMMITTEE

Prof. Dr. HOUSSAM EL DEEN MOHAMED FATHY EL-WAKIL

Professor of Genetics,
and Dean of Faculty of Agriculture
(Saba Basha),
Alexandria University

Prof. Dr. AHMED MAHMOUD EL-GAMAL

Professor of Vegetable Crops
and Head of Plant Production Department
Faculty of Agriculture (Saba Basha),

ACKNOWLEDGEMENT

Sincere thanks are due to **Prof. Dr. Houssam E.M.F. El-Wakil**, Professor of Genetics, and Dean of Faculty of Agriculture (Saba Basha), Alexandria University for his encouragement, valuable advice and continuous help throughout the course of this study.

It gives me great pleasure to express my profound and deep sense of gratitude to **Prof. Dr. A.M. El_Gamal**, Professor of Vegetable Crops and Head of Plant Production Department, Faculty of Agriculture (Saba Basha), Alexandria University for his guidance, advice and encouragement throughout the course of this investigation.

I am highly appreciate to **Prof. Dr. Aly I.A. Ebida**, Professor of Vegetable Crops, Plant Production Department, Faculty of Agriculture (Saba Basha), Alexandria University for suggesting the problem, valuable guidance, encouragement, kind advice, continuous assistance, helpful and creative discussion, and his friendly supervision.

The author wishes to express her sincere appreciation and deep gratitude thankful to **Prof. Dr. Osama M. Badawi**, Director of Sugar Crop Research Station, Sugar Crop Research Institute, Agriculture Research Center, for continuous help during the investigation.

My thanks are due to my colleagues and friends, especially the stuff members of Genetic Engineering Institute, who have helped me in one way or the other to complete this research.

My thanks are due to my colleagues and friends, especially the staff members at the Sabahia Station who have helped or sported me in one way or the other to complete this research.

Finally, my gratitude to my dear husband and my beloved children for their patience and sustained encouragement throughout the course of this study.

INTRODUCTION

INTRODUCTION

Potato (*Solanum tuberosum* L.) belongs to the family Solanaceae. It is the most important non-cereal food crop in the world. In Egypt, potato is one of the most important vegetable crop grown on a large-scale for either local consumption or exportation abroad to obtain hard currency. However, the total cultivated area was 211,461 feddans in 1998. The reciprocal yield was about 1,984,013 tons with an average of 9.4 tons/ Feddan, (Economical Report of Ministry of Agriculture, 1998). Potato is a crop plant to which *in vitro* culture technology has extensively been used. Cultures have been raised from shoots and meristems, leaf and stem segments, anther and pollen, tuber explants and from mesophyll and callus protoplasts. Tissue culture techniques can be applied not only to increase propagation rates, but also to modify germplasm (Dodds, 1989). Meristem, shoot tip and nodal segment cultures are used, in general, for production of pathogen free material and rapid propagation too. On the other hand, *in vitro* regeneration of plantlets from somatic cells is a useful tool in the improvement of potato.

The ultimate goal of the present study is to evaluate the plants derived through different *in vitro* techniques for two potato cultivars grown, widely, in Egypt, phenotypically and genetically.

Therefore, the investigation could be summarized in the following items:

1. Regeneration plants from different *in vitro* techniques, using different explants.
2. Investigating the somaclonal variation that might occur as a result of *in vitro* cultures.

3. Evaluate the somaclonal variation by using evaluational parameters; morphological, biochemical and cytological studies.
