**Faculty of Medicine
Ain Shams University
Intensive care Department**

Use of Lactate Clearance as a Predictor of Mortality Rate after Initial Resuscitation in Patient with Severe Sepsis or Septic Shock

Thesis

*Submitted for Partial Fulfillment of Master Degree
In Intensive Care*

By

Noha Mohammed Abdellah Aboassal

M.B.B.Ch.

Under Supervision of

Prof. Dr. Bassem Boulos Ghobrial

*Professor of Anesthesia, Intensive Care and Pain Management
Faculty of Medicine - Ain Shams University*

Dr. Sahar Mohamed Talaat

*Assistant Professor of Anesthesia, Intensive Care and Pain Management
Faculty of Medicine - Ain Shams University*

Dr. Karim Ahmed Sedky

*Lecturer of Anesthesia, Intensive Care and Pain Management
Faculty of Medicine - Ain Shams University*

**Faculty of Medicine
Ain Shams University
2021**

Acknowledgement

*First of all, I would like to express my deep gratitude to **ALLAH** for his care and generosity throughout my life...*

*I would like to express my sincere appreciation and my deep gratitude to **Prof. Dr. Bassem Boulos Ghobrial**, Professor of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine - Ain Shams University for his valuable advises and support through the whole work and for dedicating much of his precious time to accomplish this work. I would like to express my sincere appreciation and my deep gratitude to **Dr. Sahar Mohamed Talaat**, Assistant Professor of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine - Ain Shams University sincere efforts, fruitful encouragement and guidance. I am deeply thankful and indebted to **Dr. Karim Ahmed Sedky**, Lecturer of Anesthesia, Intensive Care and Pain Management, Faculty of Medicine - Ain Shams University for his great help and guidance through the whole work.*

*No words could adequately express my deep appreciation to **My Family** for their continuous support and guidance. I shall remain indebted to them all my life.*

Noha Aboassal

Abstract

Background: Early diagnosis of sepsis is the key for improving the survival. Culture is the diagnostic tool but the microbiological origin of infection is demonstrated in about 2/3rd of cases. Biomarkers have an important place in this process because they can indicate the presence or absence of sepsis and they are also important in evaluating the response to therapy and recovery from sepsis.

Aim of the work: to find a correlation between the lactate clearance and mortality in patients with severe sepsis.

Patients and Methods: The study was conducted on 60 adult critically ill patients of both sexes with severe sepsis, who were admitted to the unit of Critical Care Unit in Ain Shams University Hospital. All participants were subjected to the following: detailed history, full laboratory and radiological investigations to diagnose sepsis including lactate level on presentation (0 hour), after 6 hours and after 24 hours, then lactate clearance is calculated and patients were divided to lactate clearance group and non-clearance group.

Results: The study showed that clearance patients significantly had lower mortality rate, SOFA score, vasopressor therapy duration, ventilation need and hospital stay days than the non-clearance patients.

Conclusion: Lactate is a good marker for predicting mortality and evaluating the initial resuscitation and management of severe sepsis and septic shock.

Key words: lactate clearance, mortality rate, initial resuscitation, sepsis or septic shock.

Introduction

Sepsis is life-threatening organ dysfunction caused by a dysregulated host response to infection **(Singer et al., 2016)**. Severe sepsis and septic shock are the biggest cause of mortality in critically ill patients **(Gaieski et al., 2013)**. Early identification and appropriate management in the initial hours after sepsis improves outcomes **(Rhodes et al., 2016)**.

The Surviving Sepsis Campaign recommends the use of many parameters to assess perfusion in sepsis: mean arterial blood pressure (MAP), urine output, central venous oxygen saturation (ScvO₂) and arterial lactate as a resuscitation goal **(Rhodes et al., 2016)**.

Biomarkers, biologic molecules that characterize normal or pathogenic processes and can be objectively measured, have been suggested as a means of aiding diagnosis, predicting disease severity and outcome, and monitoring response to therapy. More than 170 such markers have been studied for potential use in septic patients **(Vincent et al., 2011)**.

In septic patients, biomarkers should ideally allow the differentiation between infectious and noninfectious causes of inflammation and predict the onset of the clinical
