Impact of Breastfeeding Promotion Program on Breastfeeding Pattern, Behavior and Problem Management among Maternal and Child Health Clients in Assiut

Thesis

Submitted for Partial Fulfillment
of Doctorate Degree in Public Health and Community Medicine

By

Iman Morsy Mohamed

Assistant Lecturer of Community Medicine
Faculty of Medicine
Assiut University

Supervised by

Prof.

Dr. Ali Hussein Zarzour

Head of Community Medicine Dept.
Faculty of Medicine
Assiut University

Prof.

Dr. Mohamed Hamdy Ghazaly

Prof. Of Pediatrics
Faculty of Medicine
Assiut University

Dr. Ahmed Mohamed M. Hany

Assist. Prof. of Community Medicine
Faculty of Medicine
Assiut University

(2001)

B

17-5

ACKNOWLEDGMENT

I am greatly honored to express my sincere gratitude to **Professor Dr. Ali Hussein Zarzour**, Professor and head of Public Health and Community Medicine Department, Faculty of Medicine, Assiut University, who suggested this work and kindly offered his remarkable experience. I am greatly indebted to him for his valuable guidance and close supervision throughout this work.

I would like to express my deepest thanks and gratitude to **Professor Dr. Mohamed Hamdy Ghazaly**, Professor of Pediatrics, Faculty of Medicine, Assiut University, for his continuous help and guidance, encouragement in all stages of this work, close supervision and revising the text.

I would like to express my sincere gratitude to **Dr. Ahmed Mohamed M. Hany**, Assistant Professor of Public Health and Community Medicine, Faculty of Medicine, Assiut University, for his continuous help, advice and revising the text, as well as for expert guidance in statistical analysis.

I am also indebted to **Professor Dr. Mostafa Abdel-Aziz Mostafa**, Professor of Public Health and Community Medicine, and Vice Dean of Faculty of Medicine, Suez Canal University, for his expert advice regarding methodology, as well as provision of valuable scientific materials.

My deep thanks are directed to the Ministry of Health and Population, and Assiut Health Directorate for their cooperation and permission to perform this study in the chosen MCH centers.

Contents

Introduction	1
Aim of the study	5
Review of literature:	6
□ <i>Breastfeeding status in Egypt</i>	6
I- BF pattern in Egypt	6
II- KAPs of mothers and health care providers regarding BF	10
□ <i>Benefits of breastfeeding</i>	16
- BF and infant morbidity:	18
A- BF and diarrheal morbidity	18
B- BF and acute respiratory illnesses	20
C- BF and otitis media	22
□ <i>Breastfeeding counseling</i>	24
- Counseling skills in BF	25
□ <i>Recommended breastfeeding practices during the first six months</i>	27
I- Early initiation of BF	27
II- Establishing good BF skills	28
1- Body position for mother and infant	29
2- Different BF positions	30
3- Hand position	33
4- Attaching the baby to the breast	35
I- Breastfeed exclusively for about the first 6 months	36
II- Practicing frequent, on demand feeding	37
□ <i>Breast disorders in nursing mothers</i>	39
I- Inverted nipples	39
II- Breast engorgement	43
III- Sore nipples	44
IV- Obstructed lactiferous duct	46
V- Mastitis	46
VI- Breast abscess	47
□ <i>Insufficient milk</i>	49
I- Breastmilk insufficiency, real or imagined	51
II- Parameters for evaluation of breastfed infants	52
III- Poor milk production	53

IV- How to increase a mother's milk supply	54
V- Insufficient glandular development	55
□ <i>Some infant problems with breastfeeding</i>	58
I- Sleepy infant	58
II- Jaundice in, otherwise healthy, breastfed infant	59
III- Colic and crying	62
IV- The reluctant breastfeeder	65
V- Full term infants with medical problems	67
□ <i>Promotion and support of breastfeeding:</i>	69
I- Summary of institutional actions affecting breastfeeding	69
II- Ten steps to successful breastfeeding	77
III- Baby friendly hospital initiative	85
IV- International and National Code of marketing breast-Milk Substitutes	88
V- Studies promoting breastfeeding	94
Subjects and Methods	102
- <i>Research hypothesis</i>	102
I- Study design	102
II- Study setting	102
III- Study population and sampling	103
IV- The BF promotion program	105
V- Data collection	110
VI- Statistical design	111
Results	112
Discussion	173
- <i>Impact of the BF promotion program on:</i>	177
1- BF knowledge and attitudes	177
2- Early BF practices and problems	179
3- Pattern of BF during first 6 months	185
4- Infant growth	187
5- Infant morbidity	190
6- Problems with BF	191
7- Lactational amenorrhea	196
8- Pattern of contraceptive use	197

Conclusion	199
Recommendations	201
Summary	202
References	204

Introduction

Introduction

Breastfeeding is best for women, babies, families, nations and the world. The superiority of breastfeeding to artificial feeding of infants has been well established for nutritional, biochemical, anti-infective, psychological, economic, and contraceptive reasons. Breastfeeding is a woman's right. To be breastfed is a baby's right, as well. Obstacles that block a woman's ability to breastfeed must be removed (WABA, 1995).

Breastfeeding is a unique process that: provides ideal nutrition for infants and contributes to their healthy growth and development, reduces incidence and severity of infectious diseases thereby lowering infant morbidity and mortality, contributes to women's health by reducing the risk of breast and ovarian cancer and by increasing the spaces between pregnancies, provides social and economic benefits to the family and the nations, and provides most women with a sense of satisfaction when successfully carried out (UNICEF, 1990).

Recent research has found that: these benefits increase with increased exclusiveness of breastfeeding during the first six months of life, and thereafter with increased duration of breastfeeding with complementary foods, and program interventions can result in positive changes in breastfeeding behavior (UNICEF, 1990).

A woman's choice about how best to feed her child is a personal one. However, as no woman lives in isolation, her decision is influenced by many factors. Family members, health workers, the media, religious institutions, social traditions, the work place and her own education can all have a bearing on her own decision to breastfeed, as well as her ability

to continue breastfeeding for the optimal length of time. Every woman should be able to count on full support from those around her to enable her to initiate and sustain breastfeeding. It is the responsibility of the entire community to see that the best possible nutrition and health is available to all of its members, beginning with its youngest (WABA, 1996).

Patterns of infant feeding have changed dramatically over the past several decades, with both developing and industrialized countries experiencing decreases in what was once the nearly universal practice of breastfeeding. While many causes of these changes have been proposed, maternal employment outside the house is often considered an important factor (Wright et al, 1993).

A lack of information plays a major role in choosing not to breastfeed. Differences in patterns of breastfeeding exist within and between countries and cultures. Three main factors have been described to be associated with differences in breastfeeding patterns: place of residence (urban/rural); maternal education; and income/socioeconomic status. Urban residence and modernization have most consistently been attributed to the decline of breastfeeding (Wilmoth and Elder, 1995).

It is speculated that this decline in urban areas is partially attributed to the media, where bottle-feeding is portrayed as modern and convenient. In addition, there are fewer breastfeeding role models in the urban setting where the extended family structure may not exist, and where working mothers may believe breastfeeding to be difficult while working (Wilmoth and Elder, 1995).

Trussell and others analyzed breastfeeding durations in all populations for which World Fertility Survey (WFS) or Demographic Health Survey (DHS) results were available. In the population studied, durations were consistently longer for rural women (Trussell et al, 1992).

Education as a predictor of breastfeeding differs between developing and developed countries. Educated women in most developed countries have returned to breastfeeding while their counterparts in developing countries have increasingly switched to bottle-feeding. These findings were supported with the findings from the DHS and WFS surveys. A similar negative association has been found between socio-economic status and breastfeeding (Trussell et al, 1992).

In Egypt, around one of three children is put to the breast within an hour after birth. The median duration of exclusive breastfeeding is longer for children in rural areas than in urban areas and for mothers with less than a primary education. Better-educated mothers wean their children sooner than less educated mothers (EDHS, 1998).

Interventions to promote breastfeeding should provide mothers who elect to breastfeed with the support needed to foster a successful breastfeeding experience. It has been found that mothers who surmount problems and have a long duration of breastfeeding form a positive attitude toward breastfeeding. The woman who experiences satisfaction and enjoyment from breastfeeding are willing to encourage and help friends with breastfeeding. Interventions that provide breastfeeding mothers with support and information at critical interval, during the prepartum period, may increase not only the duration of breastfeeding
