Biochemistry and Nutrition Department

# **Comparative Study of Native or Nano Quercetin on Epigenetic modification and Nephropathy Biomarkers post Challenges in Diabetic Hamsters**

Thesis

Submitted for Faculty of Women for Arts, Science and Education,  
Ain Shams University

In Partial Fulfillment for the Doctor of Philosophy  
in Science Degree (PhD) in Biochemistry and Nutrition

**By**

**Soha Shebl Tawfik Nassar**

MSc. in the Biochemistry and Nutrition Department

Biochemistry & Nutrition Department,

Faculty of Women for Arts, Science and Education, Ain Shams University

## **Supervisors:**

**Prof. Dr. Mona Ahmed Sadek**

Prof. of Biochemistry and Nutrition,

Biochemistry & Nutrition Department,

Faculty of Women for Arts, Science and Education, Ain Shams University

**Prof. Dr. Gehan Salah El-Din Moram Aly**

Prof. of Nutrition,

Biochemistry & Nutrition Department,

Faculty of Women for Arts, Science and Education, Ain Shams University

**Dr. Huda Mohammed Ismail**

Lecturer of Biochemistry and Nutrition,

Biochemistry & Nutrition Department,

Faculty of Women for Arts, Science and Education, Ain Shams University

**2021**

## ACKNOWLEDGEMENT

First and foremost, thanks to **ALLAH** for most merciful and most gracious who gave me the ability to carry out this work.

I would like to express my sincere gratitude and great thanks to **Prof. Dr. Mona Ahmed Sadek**, Prof. of Biochemistry and Nutrition, Biochemistry and Nutrition Department, Faculty of Women for Arts, Science and Education, Ain Shams University, not only for suggesting, planning the point of research and valuable supervision, but also for her great help, guidance, appropriate choice of the research topic, continuous encouragement, she tided me over many difficulties throughout this work. No words seen to be sufficient to describe, to her owe much.

I would like to express heartily thankful to **Prof. Dr. Gehan salah El-Din Moram**, Prof. of Nutrition, Biochemistry and Nutrition Department, Faculty of Women for Arts, Science and Education, Ain Shams University, for helping me, sincere advice, immense guidance and her directions which sat me on the right track as well as supporting me during all steps of this work.

My deep thanks with love to **Dr. Huda Mohamed Ismail**, lecturer of Biochemistry and Nutrition, Biochemistry and Nutrition Department, Faculty of Women for Arts, Science and Education, Ain Shams University, for helping me and valuable advice to me during all steps of this work.

I am thankful to **Prof. Dr. Kawkab Abd El-Aziz**, Prof. of histopathology, Department of Pathology, Faculty of Veterinary Medicine, Cairo University, for the help that she offered in the microscopic examination carried out in this study.

With great pleasure, I would like to express my sincere gratitude to **the staff members** of Biochemistry and Nutrition Department, Faculty of Women for Arts, Science and Education, Ain Shams University, for their encouragement to carry out this work.

*Soha Nassar*

## ABSTRACT

Diabetic nephropathy (DN) refers to the deterioration of kidney function and is one of the major public health problems, in spite of medical care developing. This disease is multifactorial and their current treatment strategies are only associated with symptomatic relief rather than curbing their progression. Phytochemicals have been consistently proposed as alternative therapy in modern medicine, but their efficacy is somewhat limited by rapid metabolism, insufficient permeability across membranes and decreased its bioavailability and stability in tissues. Fortunately, current advances in nanotechnology present opportunities to overcome such limitations in delivering active phytochemicals candidates.

The main goal of this study was to examine the possible regulatory effects of quercetin nanoparticles (QUNPs) in compare with native quercetin either with or without metformin on DN through different biological, epigenetic, molecular and biochemical measurements in addition of the histopathological changes in kidney tissues sections in DN hamsters. The first phase of this study used high resolution transmission electron microscope (HR-TEM) image to characterize QUNPs and the results revealed that average size of quercetin was in the nano-scale. The biological trial showed that DN hamsters consumed native or nano quercetin with or without metformin caused significant enhancement in nutritional parameters; change in body weight, feed intake, feed efficiency ratio, feed conversion ratio and relative weight of kidney ( $P<0.05$ ) as compared to DN untreated group. QUNPs plus metformin treated group was the most effective by virtue of their small size and characteristics, followed by group consumed native quercetin with metformin. Diabetic and nephropathy biomarkers showed a significant improvement in all treated groups as well as increase expression of insulin receptor substrate -1 (IRS-1) and glucose transporter -4 (GLUT-4) genes. Our results illustrated that the effect of QUNPs plus metformin was the most effective in IRS-1 and GLUT-4 gene expression by 618.18% and 253.33%, respectively that correlated with inhibition of histone deacetylase activity (HDACs) by 37.52% compared to DN untreated group which in turn improved diabetic and nephropathy biomarkers. Results of gene expression were confirmed by immunohistochemical analysis. Furthermore, antioxidant effects followed the same direction and were apparent through significantly increment in superoxide dismutase and glutathione peroxidase activities. Levels of metabolic dysfunction, inflammation and apoptosis also reflect the treatments on DN. The levels of inflammatory biomarkers decreased in all treated groups, while QUNPs with metformin was the most effective of all tested treatments, where the level of interleukin-6 and tumor necrosis factor- $\alpha$  was decreased by 47.37% 83.75%, respectively compared to DN untreated group. These results were confirmed by histochemical examinations in kidney tissues. Interestingly, all tested treatments significantly exhibit renal improvement; however, QUNPs with metformin was the most effective.

LIST OF ABBREVIATIONS

4-AAP	4-aminoantipyrine
-------	-------------------

<b>A/G ratio</b>	Albumin/globulins ratio
<b>AChE</b>	Acetylcholine esterase
<b>ACR</b>	Albumin: creatinine ratio
