## **THESIS**

Submitted for fulfilment of  
Master Degree In Microbiology

By

**SAMEH SAMIR HALIME**

B. V. Sc.

## **Supervised By**

**Prof. Dr. Shaban H. Ahmed**

Professor of Microbiology  
Faculty of Medicine  
Assiut University

**Prof. Dr. Abd-ELKalik A. ELTimawy**

Professor of Microbiology  
Faculty of Medicine  
Assiut University

**Dr. Ahmed Sadek Ahmed**

Assistant Professor of Microbiology  
Faculty of Medicine  
Assiut University

**Department of Microbiology and Immunology  
Faculty of Medicine  
Assiut University**

**1997**

## ACKNOWLEDGMENT

I would like to express my sincere thanks and deep appreciation to Professor Dr. **Shaban Hashem Ahmed**, professor of Microbiology, Faculty of Medicine, Assiut University, for his unlimited help, profound supervision, valuable advice and providing the facilities that made it possible to continue this work.

Words can never express my deepest gratitude to Professor Dr. **Abd ELKhalik A.ELTimawy**, Professor of Microbiology, Faculty of Medicine, Assiut University, for his continuous supervision, constant encouragement and valuable assistance.

I wish to express my deep thanks to Dr. **Ahmed Sadek Ahmed** Assitant Professor of Microbiology, Faculty of Medicine, Assiut University, for his kind help and constant encouragement . I am indebted to his as he didn't hesitate to give a great deal of his time, his knowledge and experience, during perparation of this work.

My best thanks also to Professor Dr. **Maher Mokhtar Zaki**, Professor of Microbiology, Faculty of Medicine, Assiut University, for his sincere help and co-operation.

Deepest gratitude also goes to Professor Dr. **Z. M. Kholeaf**, Head of animal reproduction disease departmant , animal reproduction research institute, Cairo. And also to Dr. **Mona M. Sobhy**, for the help and directions in carring out this study.

The encouragement, suggestions as well as the advice and support given by Dr. **Mohamed Saad Badary**, Lecturer of Microbiology, Faculty of Medicine, Assiut University.

Finally, I can not deny the role of my Professors and colleagues in the Microbiology and Immunology Department who helped and supported me in every possible way.

## **LIST OF ABBREVIATIONS**

**C.fetus = Campylobacter fetus**

**C.jejuni = Campylobacter jejuni**

**Gr. = Gram**

**I.U. = international units**

**L. = litre**

**Min. = minutes**

**ml. = milli litre**

**Sp.= species**

**Subsp. = subspecies**

# INTRODUCTION

## INTRODUCTION

Meat of animal origin is the main source of food protein in the human nutrition, the safety and wholesomeness of meat are the responsibility of the veterinary food hygienist all over the world.

It is now well known that *Campylobacter fetus subspecies jejuni* is a common cause of human enteric disease. Red meats are recognized as a vehicle of *Salmonellosis* but today, there is evidence to implicate a wide spread association between red meats and *Campylobacter* infection **Butzler and Skirrow (1979)**.

The term *Campylobacter* (Greek name, compound of campy = curved, and bacter = rod = "curved rod"), was proposed by **Sebald and Veron (1963)** as a generic name for the *Microaerophilic vibrios*, on the bases that organisms differ in the growth, biochemical character, and in DNA base content between *True vibrios* on one hand, and *Related vibrios* and *Vibrio fetus* on the other hand. *True vibrios* are strictly aerobic, ferment selected sugars with acid production, can grow on 3 % sodium chloride, have G+C content of 47.2 mol %. On the other hand *Vibrio fetus* and *Related vibrio* are microaerophilic, neither ferment nor oxidize carbohydrates and have G+C content of 30-36 mol %. In light of these distinct differences a new genus named "**Campylobacter**" was proposed.

In recent years, reports from around the world have demonstrated beyond doubt the importance of *Campylobacter jejuni* was recognized as an enteric pathogen in human beings. There is also an increasing concern over the role of food animals as reservoirs of these organisms with the implication that *Campylobacter* diarrhoea is a zoonotic infection. However, the organism has been isolated from most common domestic animal species, so it has been inferred that direct transmission of the disease to human might occur via consumption of animal products especially raw or under cooked food of animal origin. (**Garcia et al. 1985** and **Altekruse et al. 1994**).

Furthermore, a number of studies showed that *Campylobacter jejuni* is commonly found in healthy as well as diarrheatic animals and that the organism can be easily isolated from gall bladders and intestinal contents of pigs, sheeps and cattles (Smibert 1965, Blaser et al. 1980 and Munro et al. 1983 ).
